SOFA Vector/Matrix Library

PREFACE

The routines described here comprise the SOFA vector/matrix library. Their general appearance and coding style conforms to conventions agreed by the SOFA Review Board, and their functions, names and algorithms have been ratified by the Board. Procedures for soliciting and agreeing additions to the library are still evolving.

At present the routines are all written in Fortran 77, complying with the ANSI standard (X3.9-1978) except in two respects:

- (1) All routine names are prefixed with the string "iau_". If necessary, the string can be removed globally; the result is correctly functioning code.
- (2) All routines include an IMPLICIT NONE statement. This can be removed without affecting the behaviour of the code.

If the "iau_" string and/or the IMPLICIT NONE statements are removed globally, the resulting code is fully ANSI-compliant and is functionally unaffected.

GENERAL PRINCIPLES

The library consists mostly of routines which operate on ordinary Cartesian vectors (x,y,z) and 3x3 rotation matrices. However, there is also support for vectors which represent velocity as well as position and vectors which represent rotation instead of position. The vectors which represent both position and velocity may be considered still to have dimensions (3), but to comprise elements each of which is two numbers, representing the value itself and the time derivative. Thus:

- * "Position" or "p" vectors (or just plain 3-vectors) have dimension (3) in Fortran and [3] in C.
- * "Position/velocity" or "pv" vectors have dimensions (3,2) in Fortran and [2][3] in C.
- * "Rotation" or "r" matrices have dimensions (3,3) in Fortran and [3][3] in C. When used for rotation, they are "orthogonal"; the inverse of such a matrix is equal to the transpose. Most of the routines in this library do not assume that r-matrices are necessarily orthogonal and in fact work on any 3x3 matrix.
- * "Rotation" or "r" vectors have dimensions (3) in Fortran and [3] in C. Such vectors are a combination of the Euler axis and angle and are convertible to and from r-matrices. The direction is the axis of rotation and the magnitude is the angle of rotation, in radians. Because the amount of rotation can be scaled up and down simply by multiplying the vector by a scalar, r-vectors are useful for representing spins about an axis which is fixed.
- * The above rules mean that in terms of memory address, the three velocity components of a pv-vector follow the three position components. Application code is permitted to exploit this and all other knowledge of the internal layouts: that x, y and z appear in that order and are in a right-handed Cartesian coordinate system etc. For example, the cp function (copy a p-vector) can be used to copy the velocity component of a pv-vector (indeed, this is how the CPV routine is coded).
- * The routines provided do not completely fill the range of operations that link all the various vector and matrix options, but are confined to functions that are required by other parts of the SOFA software or which are likely to prove useful.

In addition to the vector/matrix routines, the library contains some routines related to spherical angles, including conversions to and from sexagesimal format.

Using the library requires knowledge of vector/matrix methods, spherical trigonometry, and methods of attitude representation. These topics are covered in many textbooks, including "Spacecraft Attitude Determination and Control", James R. Wertz (ed.), Astrophysics and Space Science Library, Vol. 73, D. Reidel Publishing Company, 1986.

OPERATIONS INVOLVING P-VECTORS AND R-MATRICES

Initialize

ZP zero p-vector

ZR initialize r-matrix to null IR initialize r-matrix to identity

Copy/extend/extract

CP copy p-vector CR copy r-matrix

Build rotations

RX rotate r-matrix about x
RY rotate r-matrix about y
RZ rotate r-matrix about z

Spherical/Cartesian conversions

S2C	spherical to unit vector
C2S	unit vector to spherical
S2P	spherical to p-vector
P2S	p-vector to spherical

Operations on vectors

PPP	p-vector plus p-vector
PMP	p-vector minus p-vector
DDCD	n worter plug goaled n

PPSP p-vector plus scaled p-vector

PDP inner (=scalar=dot) product of two p-vectors
PXP outer (=vector=cross) product of two p-vectors

PM modulus of p-vector

PN normalize p-vector returning modulus

SXP multiply p-vector by scalar

Operations on matrices

RXR r-matrix multiply TR transpose r-matrix

Matrix-vector products

RXP product of r-matrix and p-vector

TRXP product of transpose of r-matrix and p-vector

Separation and position-angle

ctors
:

SEPS angular separation from spherical coordinates

PAP position-angle from p-vectors

PAS position-angle from spherical coordinates

Rotation vectors

RV2M r-vector to r-matrix RM2V r-matrix to r-vector

```
Initialize
     ZPV
               zero pv-vector
 Copy/extend/extract
     CPV
               copy pv-vector
     P2PV
               append zero velocity to p-vector
     PV2P
               discard velocity component of pv-vector
 Spherical/Cartesian conversions
     S2PV
               spherical to pv-vector
     PV2S
               pv-vector to spherical
 Operations on vectors
     PVPPV
               pv-vector plus pv-vector
     PVMPV
               pv-vector minus pv-vector
     VAUVA
               inner (=scalar=dot) product of two pv-vectors
     PVXPV
               outer (=vector=cross) product of two pv-vectors
               modulus of pv-vector
     PVM
     SXPV
               multiply pv-vector by scalar
     S2XPV
               multiply pv-vector by two scalars
     PVU
               update pv-vector
     PVUP
               update pv-vector discarding velocity
 Matrix-vector products
     NAXA
               product of r-matrix and pv-vector
               product of transpose of r-matrix and pv-vector
     TRXPV
OPERATIONS ON ANGLES
               normalize radians to range 0 to 2pi
     ANP
     ANPM
               normalize radians to range -pi to +pi
     A2TF
               decompose radians into hms
               decompose radians into d'
     A2AF
     D2TF
               decompose days into hms
