# THE IAU-SOFA SOFTWARE LIBRARIES

SOFA stands for "Standards Of Fundamental Astronomy". The SOFA software libraries are a collection of subprograms, in sourcecode form, which implement official IAU algorithms for fundamentalastronomy computations. The subprograms at present comprise 185 "astronomy" routines supported by 55 "vector/matrix" routines, available in both Fortran77 and C implementations.

#### THE SOFA INITIATIVE

SOFA is an IAU Service which operates as a Standing Working Group under Division A (Fundamental Astronomy).

The IAU set up the SOFA initiative at the 1994 General Assembly, to promulgate an authoritative set of fundamental-astronomy constants and algorithms. At the subsequent General Assembly, in 1997, the appointment of a review board and the selection of a site for the SOFA Center (the outlet for SOFA products) were announced.

The SOFA initiative was originally proposed by the IAU Working Group on Astronomical Standards (WGAS), under the chairmanship of Toshio Fukushima. The proposal was for "...new arrangements to establish and maintain an accessible and authoritative set of constants, algorithms and procedures that implement standard models used in fundamental astronomy". The SOFA Software Libraries implement the "algorithms" part of the SOFA initiative. They were developed under the supervision of an international panel called the SOFA Board. The current membership of this panel is listed in an appendix.

A feature of the original SOFA software proposals was that the products would be self-contained and not depend on other software. This includes basic documentation, which, like the present file, will mostly be plain ASCII text. It should also be noted that there is no assumption that the software will be used on a particular computer and Operating System. Although OS-related facilities may be present (Unix make files for instance, use by the SOFA Center of automatic code management systems, HTML versions of some documentation), the routines themselves will be visible as individual text files and will run on a variety of platforms.

#### ALGORITHMS

The SOFA Board's initial goal has been to create a set of callable subprograms. Whether "subroutines" or "functions", they are all referred to simply as "routines". They are designed for use by software developers wishing to write complete applications; no runnable, freestanding applications are included in SOFA's present plans.

The algorithms are drawn from a variety of sources. Because most of the routines so far developed have either been standard "text-book" operations or implement well-documented standard algorithms, it has not been necessary to invite the whole community to submit algorithms, though consultation with authorities has occurred where necessary. It should also be noted that consistency with the conventions published by the International Earth Rotation Service was a stipulation in the original SOFA proposals, further constraining the software designs. This state of affairs will continue to exist for some time, as there is a large backlog of agreed extensions to work on. However, in the future the Board may decide to call for proposals, and is in the meantime willing to look into any suggestions that are received by the SOFA Center.

SCOPE

The routines currently available are listed in the next two chapters of this document.

The "astronomy" library comprises 189 routines (plus one obsolete Fortran routine that now appears under a revised name). The areas addressed include calendars, astrometry, time scales, Earth rotation, ephemerides, precession-nutation, star catalog transformations, gnomonic projection, horizon/equatorial transformations and geodetic/geocentric transformations.

The "vector-matrix" library, comprising 55 routines, contains a collection of simple tools for manipulating the vectors, matrices and angles used by the astronomy routines.

There is no explicit commitment by SOFA to support historical models, though as time goes on a legacy of superseded models will naturally accumulate. There is, for example, no support of B1950/FK4 star coordinates, or pre-1976 precession models, though these capabilities could be added were there significant demand.

Though the SOFA software libraries are rather limited in scope, and are likely to remain so for a considerable time, they do offer distinct advantages to prospective users. In particular, the routines are:

- \* authoritative: they are IAU-backed and have been constructed with
  great care;
- \* practical: they are straightforward to use in spite of being precise and rigorous (to some stated degree);
- \* accessible and supported: they are downloadable from an easy-tofind place, they are in an integrated and consistent form, they come with adequate internal documentation, and help for users is available.

#### VERSIONS

Once it has been published, an issue is never revised or updated, and remains accessible indefinitely. Subsequent issues may, however, include corrected versions under the original routine name and filenames. However, where a different model is introduced, it will have a different name.

The issues will be referred to by the date when they were announced. The frequency of re-issue will be decided by the Board, taking into account the importance of the changes and the impact on the user community.

#### DOCUMENTATION

At present there is little free-standing documentation about individual routines. However, each routine has preamble comments which specify in detail what the routine does and how it is used.

The files sofa\_pn\_f.pdf and sofa\_pn\_c.pdf (for Fortran and C users respectively) describe the SOFA tools for precession-nutation and other aspects of Earth attitude, and include example code and, in an appendix, diagrams showing the interrelationships between the routines supporting the latest (IAU 2006/2000A) models. Two other pairs of documents introduce time scale transformations (sofa\_ts\_f.pdf and sofa\_ts\_c.pdf) and astrometric transformations (sofa\_ast\_f.pdf and sofa\_ast\_c.pdf).

#### PROGRAMMING LANGUAGES AND STANDARDS

The SOFA routines are available in two programming languages at present: Fortran77 and ANSI C. Related software in other languages is under consideration.

The Fortran code conforms to ANSI X3.9-1978 in all but two minor

respects: each has an IMPLICIT NONE declaration, and its name has a prefix of "iau\_" and may be longer than 6 characters. A global edit to erase both of these will produce ANSI-compliant code with no change in its function.

Coding style, and restrictions on the range of language features, have been much debated by the Board, and the results comply with the majority view. There is (at present) no document that defines the standards, but the code itself offers a wide range of examples of what is acceptable.

The Fortran routines contain explicit numerical constants (the INCLUDE statement is not part of ANSI Fortran77). These are drawn from the file consts.lis, which is listed in an appendix. Constants for the SOFA/C functions are defined in a header file sofam.h.

The naming convention is such that a SOFA routine referred to generically as "EXAMPL" exists as a Fortran subprogram iau\_EXAMPL and a C function iauExampl. The calls for the two versions are very similar, with the same arguments in the same order. In a few cases, the C equivalent of a Fortran SUBROUTINE subprogram uses a return value rather than an argument.

Each language version includes a "testbed" main-program that can be used to verify that the SOFA routines have been correctly compiled on the end user's system. The Fortran and C versions are called t\_sofa\_f.for and t\_sofa\_c.c respectively. The testbeds execute every SOFA routine and check that the results are within expected accuracy margins. It is not possible to guarantee that all platforms will meet the rather stringent criteria that have been used, and an occasional warning message may be encountered on some systems.

#### COPYRIGHT ISSUES

Copyright for all of the SOFA software and documentation is owned by the IAU SOFA Board. The Software is made available free of charge for all classes of user, including commercial. However, there are strict rules designed to avoid unauthorized variants coming into circulation. It is permissible to distribute derived works and other modifications, but they must be clearly marked to avoid confusion with the SOFA originals.

Further details are included in the block of comments which concludes every routine. The text is also set out in an appendix to the present document.

#### ACCURACY

The SOFA policy is to organize the calculations so that the machine accuracy is fully exploited. The gap between the precision of the underlying model or theory and the computational resolution has to be kept as large as possible, hopefully leaving several orders of magnitude of headroom.

The SOFA routines in some cases involve design compromises between rigor and ease of use (and also speed, though nowadays this is seldom a major concern).

#### ACKNOWLEDGEMENTS

The Board is indebted to a number of contributors, who are acknowledged in the preamble comments of the routines concerned.

The Board's effort is provided by the members' individual institutes.

Resources for operating the SOFA Center are provided by Her Majesty's Nautical Almanac Office, operated by the United Kingdom Hydrographic Office.

SOFA Astronomy Library

#### PREFACE

The routines described here comprise the SOFA astronomy library. Their general appearance and coding style conforms to conventions agreed by the SOFA Board, and their functions, names and algorithms have been ratified by the Board. Procedures for soliciting and agreeing additions to the library are still evolving.

#### PROGRAMMING LANGUAGES

The SOFA routines are available in two programming languages at present: Fortran 77 and ANSI C.

Except for a single obsolete Fortran routine, which has no C equivalent, there is a one-to-one relationship between the two language versions. The naming convention is such that a SOFA routine referred to generically as "EXAMPL" exists as a Fortran subprogram iau\_EXAMPL and a C function iauExampl. The calls for the two versions are very similar, with the same arguments in the same order. In a few cases, the C equivalent of a Fortran SUBROUTINE subprogram uses a return value rather than an argument.

#### GENERAL PRINCIPLES

The principal function of the SOFA Astronomy Library is to provide definitive algorithms. A secondary function is to provide software suitable for convenient direct use by writers of astronomical applications.

The astronomy routines call on the SOFA vector/matrix library routines, which are separately listed.

The routines are designed to exploit the full floating-point accuracy of the machines on which they run, and not to rely on compiler optimizations. Within these constraints, the intention is that the code corresponds to the published formulation (if any).

Dates are always Julian Dates (except in calendar conversion routines) and are expressed as two double precision numbers which sum to the required value.

A distinction is made between routines that implement IAU-approved models and those that use those models to create other results. The former are referred to as "canonical models" in the preamble comments; the latter are described as "support routines".

Using the library requires knowledge of positional astronomy and time-scales. These topics are covered in "Explanatory Supplement to the Astronomical Almanac", 3rd Edition, Sean E. Urban & P. Kenneth Seidelmann (eds.), University Science Books, 2013. Recent developments are documented in the scientific journals, and references to the relevant papers are given in the SOFA code as required. The IERS Conventions are also an essential reference. The routines concerned with Earth attitude (precession-nutation etc.) are described in the SOFA document sofa\_pn.pdf. Those concerned with transformations between different time scales are described in sofa\_ts\_f.pdf (Fortran) and sofa\_ts\_c.pdf (C). Those concerned with astrometric transformations are described in sofa\_ast\_f.pdf (Fortran) and sofa\_ast\_c (C).

## ROUTINES

Calendars

| CAL2JD | Gregorian calendar to Julian Day number             |
|--------|---|
| EPB    | Julian Date to Besselian Epoch                      |
| EPB2JD | Besselian Epoch to Julian Date                      |
| EPJ    | Julian Date to Julian Epoch                         |
| EPJ2JD | Julian Epoch to Julian Date                         |
| JD2CAL | Julian Date to Gregorian year, month, day, fraction |
| JDCALF | Julian Date to Gregorian date for formatted output  |

Astrometry

| PNM00A | classical NPB matrix, IAU 2000A                              |
| PNM00B | classical NPB matrix, IAU 2000B                              |
| PNM06A | classical NPB matrix, IAU 2006/2000A                         |
| PNM80  | precession/nutation matrix, IAU 1976/1980                    |
| POGE   | precession angles, IAU 2006, equinox based                   |
| 1001   | preception angles, the 2000, equilion based                  |

| POM00  | polar motion matrix                     |
|--------|---|
| pr00   | IAU 2000 precession adjustments         |
| PREC76 | accumulated precession angles, IAU 1976 |
| S00    | the CIO locator s, given X,Y, IAU 2000A |
| SOOA   | the CIO locator s, IAU 2000A            |
| SOOB   | the CIO locator s, IAU 2000B            |
| S06    | the CIO locator s, given X,Y, IAU 2006  |
| S06A   | the CIO locator s, IAU 2006/2000A       |
| SP00   | the TIO locator s', IERS 2003           |
| XYOG   | CIP, IAU 2006/2000A, from series        |
| XYS00A | CIP and s, IAU 2000A                    |
| XYS00B | CIP and s, IAU 2000B                    |
| XYS06A | CIP and s, IAU 2006/2000A               |

Fundamental arguments for nutation etc.

| FAD03  | mean elongation of the Moon from the Sun    |
|--------|---|
| FAE03  | mean longitude of Earth                     |
| FAF03  | mean argument of the latitude of the Moon   |
| FAJU03 | mean longitude of Jupiter                   |
| FAL03  | mean anomaly of the Moon                    |
| FALP03 | mean anomaly of the Sun                     |
| FAMA03 | mean longitude of Mars                      |
| FAME03 | mean longitude of Mercury                   |
| FANE03 | mean longitude of Neptune                   |
| FAOM03 | mean longitude of the Moon's ascending node |
| FAPA03 | general accumulated precession in longitude |
| FASA03 | mean longitude of Saturn                    |
| FAUR03 | mean longitude of Uranus                    |
| FAVE03 | mean longitude of Venus                     |

Star catalog conversions

convert B1950.0 FK4 star catalog data to J2000.0 FK5 FK425 FK45Z convert a B1950.0 FK4 star position to J2000.0 FK5, assuming zero proper motion in the FK5 system convert J2000.0 FK5 star catalog data to B1950.0 FK4 transform FK5 star data into the Hipparcos system FK524 FK52H FK54Z convert a J2000.0 FK5 star position to B1950.0 FK4, assuming zero proper motion in FK5 system and zero parallax FK5HIP FK5 to Hipparcos rotation and spin FK5 to Hipparcos assuming zero Hipparcos proper motion transform Hipparcos star data into the FK5 system FK5HZ H2FK5 HFK5Z Hipparcos to FK5 assuming zero Hipparcos proper motion

#### Ecliptic coordinates

| ECEQ06 | ecliptic to ICRS, IAU 2006                   |  |
|--------|--|--|
| ECM06  | rotation matrix, ICRS to ecliptic, IAU 2006  |  |
| EQEC06 | ICRS to ecliptic, IAU 2006                   |  |
| LTECEQ | ecliptic to ICRS, long term                  |  |
| LTECM  | rotation matrix, ICRS to ecliptic, long-term |  |
| LTEQEC | ICRS to ecliptic, long term                  |  |

#### Galactic coordinates

| G2ICRS | transform | IAU 1958 | galactic c   | oordi | nates | s to ICRS |
|--------|-----------|----------|--------------|-------|-------|-----------|
| ICRS2G | transform | ICRS coc | ordinates to | IAU   | 1958  | Galactic  |

#### Geodetic/geocentric

| EFORM  | a,f for a nominated Earth reference ellipsoid    |
|--------|--|
| GC2GD  | geocentric to geodetic for a nominated ellipsoid |
| GC2GDE | geocentric to geodetic given ellipsoid a,f       |
| GD2GC  | geodetic to geocentric for a nominated ellipsoid |
| GD2GCE | geodetic to geocentric given ellipsoid a,f       |

#### Gnomonic projection

| TPORS | solve for tangent point, spherical              |   |
|-------|---|---|
| TPORV | solve for tangent point, vector                 |   |
| TPSTS | deproject tangent plane to celestial, spherical | 1 |
| TPSTV | deproject tangent plane to celestial, vector    |   |

TPXES project celestial to tangent plane, spherical project celestial to tangent plane, vector

Horizon/equatorial

AE2HD (azimuth, altitude) to (hour angle, declination) HD2AE (hour angle, declination) to (azimuth, altitude) HD2PA parallactic angle

Obsolete

C2TCEO former name of C2TCIO

SOFA Vector/Matrix Library

#### PREFACE

The routines described here comprise the SOFA vector/matrix library. Their general appearance and coding style conforms to conventions agreed by the SOFA Board, and their functions, names and algorithms have been ratified by the Board. Procedures for soliciting and agreeing additions to the library are still evolving.

#### PROGRAMMING LANGUAGES

The SOFA routines are available in two programming languages at present: Fortran 77 and ANSI C.

There is a one-to-one relationship between the two language versions. The naming convention is such that a SOFA routine referred to generically as "EXAMPL" exists as a Fortran subprogram iau\_EXAMPL and a C function iauExampl. The calls for the two versions are very similar, with the same arguments in the same order. In a few cases, the C equivalent of a Fortran SUBROUTINE subprogram uses a return value rather than an argument.

#### GENERAL PRINCIPLES

The library consists mostly of routines which operate on ordinary Cartesian vectors (x,y,z) and 3x3 rotation matrices. However, there is also support for vectors which represent velocity as well as position and vectors which represent rotation instead of position. The vectors which represent both position and velocity may be considered still to have dimensions (3), but to comprise elements each of which is two numbers, representing the value itself and the time derivative. Thus:

- \* "Position" or "p" vectors (or just plain 3-vectors) have dimension
  (3) in Fortran and [3] in C.
- \* "Position/velocity" or "pv" vectors have dimensions (3,2) in Fortran and [2][3] in C.
- \* "Rotation" or "r" matrices have dimensions (3,3) in Fortran and [3][3] in C. When used for rotation, they are "orthogonal"; the inverse of such a matrix is equal to the transpose. Most of the routines in this library do not assume that r-matrices are necessarily orthogonal and in fact work on any 3x3 matrix.
- \* "Rotation" or "r" vectors have dimensions (3) in Fortran and [3] in C. Such vectors are a combination of the Euler axis and angle and are convertible to and from r-matrices. The direction is the axis of rotation and the magnitude is the angle of rotation, in radians. Because the amount of rotation can be scaled up and down simply by multiplying the vector by a scalar, r-vectors are useful for representing spins about an axis which is fixed.
- \* The above rules mean that in terms of memory address, the three velocity components of a pv-vector follow the three position components. Application code is permitted to exploit this and all other knowledge of the internal layouts: that x, y and z appear in that order and are in a right-handed Cartesian coordinate system etc. For example, the cp function (copy a p-vector) can be used to copy the velocity component of a pv-vector (indeed, this is how the CPV routine is coded).
- \* The routines provided do not completely fill the range of operations that link all the various vector and matrix options, but are confined to functions that are required by other parts of the SOFA software or which are likely to prove useful.

In addition to the vector/matrix routines, the library contains some routines related to spherical angles, including conversions to and from sexagesimal format.

Using the library requires knowledge of vector/matrix methods, spherical trigonometry, and methods of attitude representation. These topics are covered in many textbooks, including "Spacecraft Attitude Determination and Control", James R. Wertz (ed.), Astrophysics and Space Science Library, Vol. 73, D. Reidel Publishing Company, 1986.

OPERATIONS INVOLVING P-VECTORS AND R-MATRICES

Initialize

| ZP | zero p-vector       |    |          |
|----|---------------------|----|----------|
| ZR | initialize r-matrix | to | null     |
| IR | initialize r-matrix | to | identity |

Copy/extend/extract

| CP | сору | p-vector |
|----|------|----------|
| CR | сору | r-matrix |

Build rotations

| RX | rotate | r-matrix | about | х |
|----|--------|----------|-------|---|
| RY | rotate | r-matrix | about | У |
| RZ | rotate | r-matrix | about | z |

Spherical/Cartesian conversions

| S2C | spherical to unit vector |
|-----|--------------------------|
| C2S | unit vector to spherical |
| S2P | spherical to p-vector    |
| P2S | p-vector to spherical    |

Operations on vectors

| PPP  | p-vector plus p-vector                         |
|------|--|
| PMP  | p-vector minus p-vector                        |
| PPSP | p-vector plus scaled p-vector                  |
| PDP  | inner (=scalar=dot) product of two p-vectors   |
| PXP  | outer (=vector=cross) product of two p-vectors |
| PM   | modulus of p-vector                            |
| PN   | normalize p-vector returning modulus           |
| SXP  | multiply p-vector by scalar                    |

Operations on matrices

| RXR | r-matrix multiply  |
|-----|--------------------|
| TR  | transpose r-matrix |

Matrix-vector products

| RXP  | product o | эf | r-matrix and | f | p-vector |     |          |
|------|-----------|----|--------------|---|----------|-----|----------|
| TRXP | product o | сf | transpose of | E | r-matrix | and | p-vector |

Separation and position-angle

| SEPP | angular separation from p-vectors             |
|------|---|
| SEPS | angular separation from spherical coordinates |
| PAP  | position-angle from p-vectors                 |
| PAS  | position-angle from spherical coordinates     |

Rotation vectors

| RV2M | r-vector | to | r-matrix |
|------|----------|----|----------|
| RM2V | r-matrix | to | r-vector |

OPERATIONS INVOLVING PV-VECTORS

Initialize

ZPV zero pv-vector

Copy/extend/extract

| CPV  | copy pv-vector                          |
|------|---|
| P2PV | append zero velocity to p-vector        |
| PV2P | discard velocity component of pv-vector |

Spherical/Cartesian conversions

| S2PV | spherical | to | pv-vector |
|------|-----------|----|-----------|
| PV2S | pv-vector | to | spherical |

Operations on vectors

| PVPPV | pv-vector plus pv-vector                        |
|-------|---|
| PVMPV | pv-vector minus pv-vector                       |
| PVDPV | inner (=scalar=dot) product of two pv-vectors   |
| PVXPV | outer (=vector=cross) product of two pv-vectors |
| PVM   | modulus of pv-vector                            |
| SXPV  | multiply pv-vector by scalar                    |
| S2XPV | multiply pv-vector by two scalars               |
| PVU   | update pv-vector                                |
| PVUP  | update pv-vector discarding velocity            |

Matrix-vector products

| RXPV  | product c | Σf | r-matrix and | pv-v | rectoi | 2   |           |
|-------|-----------|----|--------------|------|--------|-----|-----------|
| TRXPV | product c | οf | transpose of | r-ma | trix   | and | pv-vector |

# OPERATIONS ON ANGLES

| ANP  | normalize radians to range 0 to 2pi                    |
|------|--|
| ANPM | normalize radians to range -pi to +pi                  |
| A2TF | decompose radians into hours, minutes, seconds         |
| A2AF | decompose radians into degrees, arcminutes, arcseconds |
| AF2A | degrees, arcminutes, arcseconds to radians             |
| D2TF | decompose days into hours, minutes, seconds            |
| TF2A | hours, minutes, seconds to radians                     |
| TF2D | hours, minutes, seconds to days                        |

           double ppr[3])
/*
**
    _ _ _ _ _ _
* *
    iauAb
* *
    _ _ _ _ _ _
* *
* *
    Apply aberration to transform natural direction into proper
* *
    direction.
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
    Status: support function.
* *
* *
    Given:
* *
               double[3]
                            natural direction to the source (unit vector)
      pnat
* *
               double[3]
                            observer barycentric velocity in units of c
      v
* *
               double
                            distance between the Sun and the observer (au)
      S
* *
      bm1
               double
                            sqrt(1-|v|^2): reciprocal of Lorenz factor
* *
* *
    Returned:
* *
               double[3] proper direction to source (unit vector)
      ppr
* *
* *
    Notes:
* *
* *
    1) The algorithm is based on Expr. (7.40) in the Explanatory
* *
       Supplement (Urban & Seidelmann 2013), but with the following
* *
       changes:
* *
* *
       o Rigorous rather than approximate normalization is applied.
* *
* *
       o The gravitational potential term from Expr. (7) in
          Klioner (2003) is added, taking into account only the Sun's contribution. This has a maximum effect of about
* *
* *
* *
           0.4 microarcsecond.
* *
* *
    2) In almost all cases, the maximum accuracy will be limited by the
* *
       supplied velocity. For example, if the SOFA iauEpv00 function is
* *
       used, errors of up to 5 microarcseconds could occur.
* *
* *

* *
* *
    Horizon to equatorial coordinates: transform azimuth and altitude
* *
    to hour angle and declination.
* *
* *
    Given:
* *
                 double
                               azimuth
       az
* *
       el
                 double
                               altitude (informally, elevation)
* *
       phi
                 double
                               site latitude
* *
* *
    Returned:
* *
                 double
                               hour angle (local)
       ha
* *
       dec
                 double
                               declination
* *
* *
    Notes:
* *
* *
    1) All the arguments are angles in radians.
* *
* *
    2) The sign convention for azimuth is north zero, east +pi/2.
* *
* *
    3) HA is returned in the range +/-pi. Declination is returned in
* *
        the range +/-pi/2.
* *
* *
    4) The latitude phi is pi/2 minus the angle between the Earth's
* *
        rotation axis and the adopted zenith. In many applications it
* *
        will be sufficient to use the published geodetic latitude of the
* *
        site. In very precise (sub-arcsecond) applications, phi can be
* *
        corrected for polar motion.
* *
* *
    5) The azimuth az must be with respect to the rotational north pole,
* *
        as opposed to the ITRS pole, and an azimuth with respect to north
        on a map of the Earth's surface will need to be adjusted for polar motion if sub-arcsecond accuracy is required.
* *
* *
* *
* *
    6) Should the user wish to work with respect to the astronomical
* *
        zenith rather than the geodetic zenith, phi will need to be
* *
        adjusted for deflection of the vertical (often tens of
* *
        arcseconds), and the zero point of ha will also be affected.
* *
* *
    7) The transformation is the same as Ve = Ry(phi-pi/2)*Rz(pi)*Vh,
* *
        where Ve and Vh are lefthanded unit vectors in the (ha,dec) and
* *
         (az,el) systems respectively and Rz and Ry are rotations about
* *
         first the z-axis and then the y-axis. (n.b. Rz(pi) simply
        reverses the signs of the \boldsymbol{x} and \boldsymbol{y} components.) For efficiency,
* *
* *
        the algorithm is written out rather than calling other utility
* *
        functions. For applications that require even greater efficiency, additional savings are possible if constant terms
* *
* *
        such as functions of latitude are computed once and for all.
* *
* *
    8) Again for efficiency, no range checking of arguments is carried
* *
        out.
* *
* *

    SOFA Software License
* *
    _____
* *
* *
    NOTICE TO USER:
* *
* *
    BY USING THIS SOFTWARE YOU ACCEPT THE FOLLOWING SIX TERMS AND
* *
    CONDITIONS WHICH APPLY TO ITS USE.
* *
* *
    1. The Software is owned by the IAU SOFA Board ("SOFA").
* *
* *
    2. Permission is granted to anyone to use the SOFA software for any
* *
        purpose, including commercial applications, free of charge and
* *
        without payment of royalties, subject to the conditions and
* *
        restrictions listed below.
* *
    3. You (the user) may copy and distribute SOFA source code to others, and use and adapt its code and algorithms in your own software,
* *
* *
       on a world-wide, royalty-free basis. That portion of your
distribution that does not consist of intact and unchanged copies
of SOFA source code files is a "derived work" that must comply
* *
* *
* *
* *
        with the following requirements:
* *
* *
        a) Your work shall be marked or carry a statement that it
* *
            (i) uses routines and computations derived by you from
            software provided by SOFA under license to you; and (ii) does not itself constitute software provided by and/or
* *
* *
* *
            endorsed by SOFA.
* *
        b) The source code of your derived work must contain descriptions
* *
* *
            of how the derived work is based upon, contains and/or differs
* *
            from the original SOFA software.
* *
* *
        c) The names of all routines in your derived work shall not
* *
            include the prefix "iau" or "sofa" or trivial modifications
* *
            thereof such as changes of case.
* *
       d) The origin of the SOFA components of your derived work must
not be misrepresented; you must not claim that you wrote the
original software, nor file a patent application for SOFA
* *
* *
* *
* *
            software or algorithms embedded in the SOFA software.
* *
* *
        e) These requirements must be reproduced intact in any source
* *
            distribution and shall apply to anyone to whom you have
* *
            granted a further right to modify the source code of your
* *
            derived work.
* *
* *
        Note that, as originally distributed, the SOFA software is
* *
        intended to be a definitive implementation of the IAU standards,
* *
        and consequently third-party modifications are discouraged. All
**
        variations, no matter how minor, must be explicitly marked as
```

```
* *
        such, as explained above.
* *
* *
    4. You shall not cause the SOFA software to be brought into
* *
        disrepute, either by misuse, or use for inappropriate tasks, or
* *
       by inappropriate modification.
* *
* *
    5. The SOFA software is provided "as is" and SOFA makes no warranty
* *
                                          SOFA does not and cannot warrant
        as to its use or performance.
* *
        the performance or results which the user may obtain by using the
       SOFA software. SOFA makes no warranties, express or implied, as to non-infringement of third party rights, merchantability, or
* *
* *
* *
        fitness for any particular purpose. In no event will SOFA be
       liable to the user for any consequential, incidental, or special damages, including any lost profits or lost savings, even if a
* *
* *
* *
        SOFA representative has been advised of such damages, or for any
* *
        claim by any third party.
* *
* *
    6. The provision of any version of the SOFA software under the terms
* *
        and conditions specified herein does not imply that future
* *
       versions will also be made available under the same terms and
* *
       conditions.
*
* *
    In any published work or commercial product which uses the SOFA
* *
    software directly, acknowledgement (see www.iausofa.org) is
* *
    appreciated.
* *
* *
    Correspondence concerning SOFA software should be addressed as
* *
    follows:
* *
* *
        By email: sofa@ukho.gov.uk
* *
        By post:

    Convert degrees, arcminutes, arcseconds to radians.
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
    Status: support function.
* *
* *
    Given:
* *
                          sign: '-' = negative, otherwise positive
                 char
      s
* *
       ideg
                 int
                          degrees
* *
       iamin
                 int
                          arcminutes
* *
                 double arcseconds
       asec
* *
* *
    Returned:
* *
      rad
                 double angle in radians
* *
* *
    Returned (function value):
* *
                         status: 0 = OK
                  int
* *
                                    1 = ideg outside range 0-359
* *
                                    2 = \text{iamin outside range } 0-59
* *
                                    3 = asec outside range 0-59.999...
* *
* *
    Notes:
* *
* *
    1) The result is computed even if any of the range checks fail.
* *
* *
    2) Negative ideg, iamin and/or asec produce a warning status, but
* *
        the absolute value is used in the conversion.
* *
* *
    3) If there are multiple errors, the status value reflects only the
* *
        first, the smallest taking precedence.

                              unchanged
* *
* *
    Notes:
* *
* *
    1) The TDB date date1+date2 is a Julian Date, apportioned in any
* *
       convenient way between the two arguments. For example,
* *
       JD(TDB)=2450123.7 could be expressed in any of these ways, among
* *
       others:
* *
* *
               date1
                               date2
* *
* *
            2450123.7
                                 0.0
                                            (JD method)
* *
                                             (J2000 method)
                             -1421.3
            2451545.0
* *
            2400000.5
                                             (MJD method)
                             50123.2
* *
            2450123.5
                                 0.2
                                             (date & time method)
* *
* *
       The JD method is the most natural and convenient to use in cases
* *
       where the loss of several decimal digits of resolution is
* *
       acceptable. The J2000 method is best matched to the way the
* *
       argument is handled internally and will deliver the optimum
* *
       resolution. The MJD method and the date & time methods are both
* *

* *
    Notes:
* *
    1) The TDB date date1+date2 is a Julian Date, apportioned in any convenient way between the two arguments. For example,
* *
* *
* *
       JD(TDB)=2450123.7 could be expressed in any of these ways, among
* *
       others:
* *
* *
               date1
                                date2
* *
* *
            2450123.7
                                  0.0
                                             (JD method)
* *
                              -1421.3
                                              (J2000 method)
            2451545.0
* *
            2400000.5
                              50123.2
                                              (MJD method)
* *
            2450123.5
                                  0.2
                                              (date & time method)
* *
* *
       The JD method is the most natural and convenient to use in cases
       where the loss of several decimal digits of resolution is
* *
* *
       acceptable. The J2000 method is best matched to the way the
* *
       argument is handled internally and will deliver the optimum
* *
       resolution. The MJD method and the date & time methods are both
* *
       good compromises between resolution and convenience. For most
* *
       applications of this function the choice will not be at all
* *
       critical.
* *
* *
       TT can be used instead of TDB without any significant impact on
* *
       accuracy.
* *
* *
    2) All the vectors are with respect to BCRS axes.
* *

* *
    Notes:
* *
* *
    1) The TDB date date1+date2 is a Julian Date, apportioned in any
       convenient way between the two arguments. For example,
* *
* *
       JD(TDB)=2450123.7 could be expressed in any of these ways, among
* *
       others:
* *
* *
              date1
                               date2
* *
* *
           2450123.7
                                 0.0
                                            (JD method)
* *
                             -1421.3
           2451545.0
                                            (J2000 method)
* *
           2400000.5
                             50123.2
                                            (MJD method)
* *
           2450123.5
                                 0.2
                                            (date & time method)
* *
* *
       The JD method is the most natural and convenient to use in cases
* *
       where the loss of several decimal digits of resolution is
* *
       acceptable. The J2000 method is best matched to the way the
* *
       argument is handled internally and will deliver the optimum
* *
       resolution. The MJD method and the date & time methods are both
* *
       good compromises between resolution and convenience. For most
* *
       applications of this function the choice will not be at all
* *
       critical.
* *
* *
       TT can be used instead of TDB without any significant impact on
* *
       accuracy.
* *
```

\* \* 2) All the vectors are with respect to BCRS axes. \* \* \* \* 3) In cases where the caller wishes to supply his own Earth \* \* ephemeris and CIP/CIO, the function iauApci can be used instead \* \* of the present function. \* \* \* \* 4) This is one of several functions that inserts into the astrom \* \* structure star-independent parameters needed for the chain of \* \* astrometric transformations ICRS <-> GCRS <-> CIRS <-> observed. \* \* \* \* The various functions support different classes of observer and \* \* portions of the transformation chain: \* \* \* \* functions observer transformation \* \* \* \* iauApcg iauApcg13 geocentric ICRS <-> GCRS iauApci iauApci13 \* \* ICRS <-> CIRS terrestrial \* \* iauApco iauApco13 ICRS <-> observed terrestrial \* \* iauApcs iauApcs13 ICRS <-> GCRS space \* \* iauAper iauAper13 terrestrial update Earth rotation \* \* iauApio iauApio13 CIRS <-> observed terrestrial \* \* \* \* Those with names ending in "13" use contemporary SOFA models to \* \* compute the various ephemerides. The others accept ephemerides \* \* supplied by the caller. \* \* \* \* The transformation from ICRS to GCRS covers space motion, \* \* parallax, light deflection, and aberration. From GCRS to CIRS \* \* comprises frame bias and precession-nutation. From CIRS to observed takes account of Earth rotation, polar motion, diurnal aberration and parallax (unless subsumed into the ICRS <-> GCRS \* \* \* \* \* \* transformation), and atmospheric refraction. \* \* \* \* 5) The context structure astrom produced by this function is used by \* \* iauAtcig\* and iauAticg\*. \* \* \* \* Called: \* \* iauEpv00 Earth position and velocity \* \* iauPnm06a classical NPB matrix, IAU 2006/2000A \* \* extract CIP X,Y coordinates from NPB matrix iauBpn2xy \* \* iauS06 the CIO locator s, given X,Y, IAU 2006 astrometry parameters, ICRS-CIRS equation of the origins, given NPB matrix and s \* \* iauApci \* \* iauEors \* \* \*/

The caller supplies the Earth ephemeris, the Earth \* \* rotation information and the refraction constants as well as the \* \* site coordinates. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* date1 double TDB as a 2-part... \* \* date2 double ...Julian Date (Note 1) \* \* double[2][3] Earth barycentric PV (au, au/day, Note 2) ebpv \* \* ehp double[3] Earth heliocentric P (au, Note 2) \* \* double CIP X,Y (components of unit vector) x,y \* \* the CIO locator s (radians) s double \* \* theta double Earth rotation angle (radians) \* \* elong double longitude (radians, east +ve, Note 3) \* \* latitude (geodetic, radians, Note 3) phi double \* \* ĥm double height above ellipsoid (m, geodetic, Note 3) \* \* xp,yp double polar motion coordinates (radians, Note 4) \* \* spdouble the TIO locator s' (radians, Note 4) refraction constant A (radians, Note 5) refraction constant B (radians, Note 5) \* \* refa double \* \* refb double \* \* \* \* Returned: \* \* astrom iauASTROM\* star-independent astrometry parameters: \* \* pmt double PM time interval (SSB, Julian years) \* \* eb double[3] SSB to observer (vector, au) Sun to observer (unit vector) \* \* double[3] eh \* \* double distance from Sun to observer (au) em barycentric observer velocity (vector, c) sqrt(1- $|v|^2$ ): reciprocal of Lorenz factor \* \* v double[3] \* \* bm1 double \* \* bpn double[3][3] bias-precession-nutation matrix \* \* along double longitude + s' (radians) \* \* polar motion xp wrt local meridian (radians) double xpl \* \* ypl double polar motion yp wrt local meridian (radians) sine of geodetic latitude \* \* sphi double \* \* double cosine of geodetic latitude cphi \* \* magnitude of diurnal aberration vector diurab double \* \* eral double "local" Earth rotation angle (radians) \* \* refraction constant A (radians) refa double \* \* refb double refraction constant B (radians) \* \* \* \* Notes: \* \* \* \* 1) The TDB date date1+date2 is a Julian Date, apportioned in any \* \* convenient way between the two arguments. For example, \* \* JD(TDB)=2450123.7 could be expressed in any of these ways, among \* \* others: \* \* \* \* date1 date2 \* \* \* \* 2450123.7 0.0 (JD method) -1421.3 \* \* 2451545.0 (J2000 method) \* \* 2400000.5 50123.2 (MJD method) \* \* 2450123.5 0.2 (date & time method)

\* \* \* \* The JD method is the most natural and convenient to use in cases \* \* where the loss of several decimal digits of resolution is \* \* acceptable. The J2000 method is best matched to the way the \* \* argument is handled internally and will deliver the optimum \* \* resolution. The MJD method and the date & time methods are both \* \* good compromises between resolution and convenience. For most \* \* applications of this function the choice will not be at all \* \* critical. \* \* \* \* TT can be used instead of TDB without any significant impact on \* \* accuracy. \* \* \* \* 2) The vectors eb, eh, and all the astrom vectors, are with respect \* \* to BCRS axes. \* \* \* \* 3) The geographical coordinates are with respect to the WGS84 \* \* reference ellipsoid. TAKE CARE WITH THE LONGITUDE SIGN \* \* CONVENTION: the longitude required by the present function is \* \* right-handed, i.e. east-positive, in accordance with geographical \* \* convention. \* \* \* \* 4) xp and yp are the coordinates (in radians) of the Celestial Intermediate Pole with respect to the International Terrestrial \* \* \* \* Reference System (see IERS Conventions), measured along the \* \* meridians 0 and 90 deg west respectively. sp is the TIO locator \* \*  $\mathbf{s}^{\,\prime}\,,$  in radians, which positions the Terrestrial Intermediate \* \* Origin on the equator. For many applications, xp, yp and \* \* (especially) sp can be set to zero. \* \* \* \* Internally, the polar motion is stored in a form rotated onto the \* \* local meridian. \* \* \* \* 5) The refraction constants refa and refb are for use in a \* \*  $dZ = A*tan(Z)+B*tan^3(Z)$  model, where Z is the observed \* \* (i.e. refracted) zenith distance and dZ is the amount of \* \* refraction. \* \* \* \* 6) It is advisable to take great care with units, as even unlikely \* \* values of the input parameters are accepted and processed in \* \* accordance with the models used. \* \* \* \* 7) In cases where the caller does not wish to provide the Earth \* \* Ephemeris, the Earth rotation information and refraction \* \* constants, the function iauApcol3 can be used instead of the \* \* present function. This starts from UTC and weather readings etc. \* \* and computes suitable values using other SOFA functions. \* \* \* \* 8) This is one of several functions that inserts into the astrom \* \* structure star-independent parameters needed for the chain of \* \* astrometric transformations ICRS <-> GCRS <-> CIRS <-> observed. \* \* \* \* The various functions support different classes of observer and \* \* portions of the transformation chain: \* \* \* \* functions observer transformation \* \* \* \* iauApcg iauApcg13 ICRS <-> GCRS geocentric \* \* iauApci iauApci13 terrestrial ICRS <-> CIRS \* \* ICRS <-> observed iauApco iauApco13 terrestrial \* \* iauApcs iauApcs13 space ICRS <-> GCRS \* \* terrestrial iauAper iauAper13 update Earth rotation \* \* iauApio iauApio13 terrestrial CIRS <-> observed \* \* \* \* Those with names ending in "13" use contemporary SOFA models to \* \* compute the various ephemerides. The others accept ephemerides supplied by the caller. \* \* \* \* \* \* The transformation from ICRS to GCRS covers space motion, parallax, light deflection, and aberration. From GCRS to CIRS \* \* \* \* comprises frame bias and precession-nutation. From CIRS to \* \* observed takes account of Earth rotation, polar motion, diurnal aberration and parallax (unless subsumed into the ICRS <-> GCRS \* \*

\*\* transformation), and atmospheric reflected
\*\*
\*\* 9) The context structure astrom produced by this function is used by
\*\* iauAtioq, iauAtoiq, iauAtciq\* and iauAticq\*.

* *
* *
    Notes:
* *
* *
    1) utcl+utc2 is quasi Julian Date (see Note 2), apportioned in any
* *
        convenient way between the two arguments, for example where utcl
* *
        is the Julian Day Number and utc2 is the fraction of a day.
* *
* *
        However, JD cannot unambiguously represent UTC during a leap
* *
        second unless special measures are taken. The convention in the
* *
        present function is that the JD day represents UTC days whether
```

\* \* the length is 86399, 86400 or 86401 SI seconds. \* \* \* \* Applications should use the function iauDtf2d to convert from calendar date and time of day into 2-part quasi Julian Date, as it implements the leap-second-ambiguity convention just \* \* \* \* \* \* described. \* \* \* \* The warning status "dubious year" flags UTCs that predate the 2) \* \* introduction of the time scale or that are too far in the \* \* future to be trusted. See iauDat for further details. \* \* \* \* 3) UT1-UTC is tabulated in IERS bulletins. It increases by exactly \* \* one second at the end of each positive UTC leap second, \* \* introduced in order to keep UT1-UTC within +/-0.9s. n.b. This \* \* practice is under review, and in the future UT1-UTC may grow \* \* essentially without limit. \* \* \* \* 4) The geographical coordinates are with respect to the WGS84 reference ellipsoid. TAKE CARE WITH THE LONGITUDE SIGN: the longitude required by the present function is east-positive \* \* the \* \* \* \* (i.e. right-handed), in accordance with geographical convention. \* \* \* \* 5) The polar motion xp,yp can be obtained from IERS bulletins. The \* \* values are the coordinates (in radians) of the Celestial \* \* Intermediate Pole with respect to the International Terrestrial \* \* Reference System (see IERS Conventions 2003), measured along the \* \* meridians 0 and 90 deg west respectively. For many \* \* applications, xp and yp can be set to zero. \* \* \* \* Internally, the polar motion is stored in a form rotated onto \* \* the local meridian. \* \* \* \* 6) If hm, the height above the ellipsoid of the observing station \* \* in meters, is not known but phpa, the pressure in hPa (=mB), is \* \* available, an adequate estimate of hm can be obtained from the \* \* expression \* \* \* \* hm = -29.3 \* tsl \* log ( phpa / 1013.25 ); \* \* \* \* where tsl is the approximate sea-level air temperature in K \* \* (See Astrophysical Quantities, C.W.Allen, 3rd edition, section 52). Similarly, if the pressure phpa is not known, it can be estimated from the height of the observing station, hm, as \* \* \* \* \* \* follows: \* \* \* \* phpa = 1013.25 \* exp ( -hm / ( 29.3 \* tsl ) ); \* \* Note, however, that the refraction is nearly proportional to the pressure and that an accurate phpa value is important for \* \* \* \* \* \* precise work. \* \* 7) The argument wl specifies the observing wavelength in \* \* \* \* micrometers. The transition from optical to radio is assumed to \* \* occur at 100 micrometers (about 3000 GHz). \* \* \* \* 8) It is advisable to take great care with units, as even unlikely \* \* values of the input parameters are accepted and processed in \* \* accordance with the models used. \* \* \* \* In cases where the caller wishes to supply his own Earth 9) \* \* ephemeris, Earth rotation information and refraction constants, \* \* the function iauApco can be used instead of the present function. \* \* \* \* 10) This is one of several functions that inserts into the astrom \* \* structure star-independent parameters needed for the chain of \* \* astrometric transformations ICRS <-> GCRS <-> CIRS <-> observed. \* \* \* \* The various functions support different classes of observer and portions of the transformation chain: \* \* \* \* \* \* functions observer transformation \* \* \* \* iauApcg iauApcg13 geocentric ICRS <-> GCRS

    Notes:
* *
* *
    1) The TDB date date1+date2 is a Julian Date, apportioned in any
       convenient way between the two arguments. For example, JD(TDB)=2450123.7 could be expressed in any of these ways, among
* *
* *
* *
       others:
* *
* *
              date1
                              date2
* *
* *
           2450123.7
                                 0.0
                                           (JD method)
* *
                            -1421.3
                                           (J2000 method)
           2451545.0
* *
           2400000.5
                            50123.2
                                           (MJD method)
* *
           2450123.5
                                           (date & time method)
                                0.2
* *
* *
       The JD method is the most natural and convenient to use in cases
* *
       where the loss of several decimal digits of resolution is
* *
       acceptable. The J2000 method is best matched to the way the
* *
       argument is handled internally and will deliver the optimum
* *
       resolution. The MJD method and the date & time methods are both
* *
       good compromises between resolution and convenience. For most
* *
       applications of this function the choice will not be at all
* *
       critical.
* *
```

\* \* TT can be used instead of TDB without any significant impact on \* \* accuracy. \* \* \* \* 2) All the vectors are with respect to BCRS axes. \* \* \* \* 3) Providing separate arguments for (i) the observer's geocentric \* \* position and velocity and (ii) the Earth ephemeris is done for \* \* convenience in the geocentric, terrestrial and Earth orbit cases. \* \* For deep space applications it maybe more convenient to specify \* \* zero geocentric position and velocity and to supply the \* \* observer's position and velocity information directly instead of \* \* with respect to the Earth. However, note the different units: \* \* m and m/s for the geocentric vectors, au and au/day for the \* \* heliocentric and barycentric vectors. \* \* \* \* 4) In cases where the caller does not wish to provide the Earth ephemeris, the function iauApcs13 can be used instead of the \* \* \* \* present function. This computes the Earth ephemeris using the \* \* SOFA function iauEpv00. \* \* \* \* 5) This is one of several functions that inserts into the astrom structure star-independent parameters needed for the chain of \* \* \* \* astrometric transformations ICRS <-> GCRS <-> CIRS <-> observed. \* \* \* \* The various functions support different classes of observer and \* \* portions of the transformation chain: \* \* \* \* functions observer transformation \* \* \* \* iauApcg iauApcg13 ICRS <-> GCRS geocentric \* \* ICRS <-> CIRS iauApci iauApci13 terrestrial \* \* ICRS <-> observed iauApco iauApco13 terrestrial \* \* space ICRS <-> GCRS iauApcs iauApcs13 \* \* iauAper iauAper13 terrestrial update Earth rotation \* \* iauApio iauApio13 CIRS <-> observed terrestrial \* \* \* \* Those with names ending in "13" use contemporary SOFA models to \* \* compute the various ephemerides. The others accept ephemerides \* \* supplied by the caller. \* \* \* \* The transformation from ICRS to GCRS covers space motion, \* \* parallax, light deflection, and aberration. From GCRS to CIRS \* \* comprises frame bias and precession-nutation. From CIRS to \* \* observed takes account of Earth rotation, polar motion, diurnal aberration and parallax (unless subsumed into the ICRS <-> GCRS \* \* \* \* transformation), and atmospheric refraction. \* \* \* \* 6) The context structure astrom produced by this function is used by \* \* iauAtciq\* and iauAticq\*. \* \* \* \* Called: \* \* iauCp copy p-vector \* \* iauPm modulus of p-vector decompose p-vector into modulus and direction \* \* iauPn \* \* initialize r-matrix to identity iauIr \* \* \*/

void iauApio(double sp, double theta, double elong, double phi, double hm, double xp, double yp, double refa, double refb, iauASTROM \*astrom) /\* \* \* \* \* iauApio \* \* \* \* \* \* For a terrestrial observer, prepare star-independent astrometry \* \* parameters for transformations between CIRS and observed \* \* coordinates. The caller supplies the Earth orientation information \* \* and the refraction constants as well as the site coordinates. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* double the TIO locator s' (radians, Note 1) sp \* \* theta double Earth rotation angle (radians) \* \* elong double longitude (radians, east +ve, Note 2) geodetic latitude (radians, Note 2) \* \* phi double \* \* double height above ellipsoid (m, geodetic Note 2) hm \* \* xp,yp double polar motion coordinates (radians, Note 3) \* \* refa refraction constant A (radians, Note 4) double \* \* refb double refraction constant B (radians, Note 4) \* \* \* \* Returned: \* \* astrom iauASTROM\* star-independent astrometry parameters: \* \* pmt double unchanged \* \* double[3] eb unchanged \* \* eh double[3] unchanged \* \* em double unchanged \* \* double[3] v unchanged \* \* bm1 double unchanged \* \* double[3][3] unchanged bpn \* \* along double longitude + s' (radians) polar motion xp wrt local meridian (radians) polar motion yp wrt local meridian (radians) \* \* double rbl \* \* double ypl \* \* sphi double sine of geodetic latitude cosine of geodetic latitude magnitude of diurnal aberration vector \* \* cphi double \* \* diurab double \* \* eral double "local" Earth rotation angle (radians) refraction constant A (radians) refraction constant B (radians) \* \* refa double \* \* refb double \* \* \* \* Notes: \* \* \* \* 1) sp, the TIO locator s', is a tiny quantity needed only by the \* \* most precise applications. It can either be set to zero or \* \* predicted using the SOFA function iauSp00. \* \* \* \* 2) The geographical coordinates are with respect to the WGS84 reference ellipsoid. TAKE CARE WITH THE LONGITUDE SIGN: the longitude required by the present function is east-positive \* \* \* \* \* \* (i.e. right-handed), in accordance with geographical convention. \* \* \* \* 3) The polar motion xp,yp can be obtained from IERS bulletins. The \* \* values are the coordinates (in radians) of the Celestial \* \* Intermediate Pole with respect to the International Terrestrial \* \* Reference System (see IERS Conventions 2003), measured along the \* \* meridians 0 and 90 deg west respectively. For many applications, \* \* xp and yp can be set to zero. \* \* \* \* Internally, the polar motion is stored in a form rotated onto the \* \* local meridian. \* \* \* \* 4) The refraction constants refa and refb are for use in a \* \*  $dZ = A*tan(Z)+B*tan^3(Z)$  model, where Z is the observed

\* \* (i.e. refracted) zenith distance and dZ is the amount of \* \* refraction. \* \* \* \* 5) It is advisable to take great care with units, as even unlikely \* \* values of the input parameters are accepted and processed in \* \* accordance with the models used. \* \* \* \* 6) In cases where the caller does not wish to provide the Earth \* \* rotation information and refraction constants, the function \* \* iauApiol3 can be used instead of the present function. This starts from UTC and weather readings etc. and computes suitable \* \* \* \* values using other SOFA functions. \* \* \* \* 7) This is one of several functions that inserts into the astrom \* \* structure star-independent parameters needed for the chain of \* \* astrometric transformations ICRS <-> GCRS <-> CIRS <-> observed. \* \* \* \* The various functions support different classes of observer and portions of the transformation chain: \* \* \* \* \* \* functions transformation observer \* \* \* \* iauApcg iauApcg13 geocentric ICRS <-> GCRS \* \* iauApci iauApci13 terrestrial ICRS <-> CIRS \* \* ICRS <-> observed iauApco iauApco13 terrestrial \* \* iauApcs iauApcs13 ICRS <-> GCRS space \* \* iauAper iauAper13 update Earth rotation terrestrial \* \* iauApio iauApio13 terrestrial CIRS <-> observed \* \* \* \* Those with names ending in "13" use contemporary SOFA models to \* \* compute the various ephemerides. The others accept ephemerides \* \* supplied by the caller. \* \* \* \* The transformation from ICRS to GCRS covers space motion, \* \* parallax, light deflection, and aberration. From GCRS to CIRS \* \* comprises frame bias and precession-nutation. From CIRS to \* \* observed takes account of Earth rotation, polar motion, diurnal \* \* aberration and parallax (unless subsumed into the ICRS <-> GCRS \* \* transformation), and atmospheric refraction. \* \* \* \* 8) The context structure astrom produced by this function is used by \* \* iauAtioq and iauAtoiq. \* \* \* \* Called: \* \* iauPvtob position/velocity of terrestrial station \* \* astrometry parameters: update ERA iauAper \* \* \* /

double phpa, double tc, double rh, double wl, iauASTROM \*astrom) /\* \* \* \* \* iauApio13 \* \* \* \* \* \* For a terrestrial observer, prepare star-independent astrometry \* \* parameters for transformations between CIRS and observed \* \* coordinates. The caller supplies UTC, site coordinates, ambient air \* \* conditions and observing wavelength. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* utc1 double UTC as a 2-part... \* \* ...quasi Julian Date (Notes 1,2) utc2 double \* \* dut1 double UT1-UTC (seconds) \* \* elong double longitude (radians, east +ve, Note 3) \* \* double geodetic latitude (radians, Note 3) phi \* \* hm double height above ellipsoid (m, geodetic Notes 4,6) \* \* polar motion coordinates (radians, Note 5) xp,yp double \* \* pressure at the observer (hPa = mB, Note 6) double phpa \* \* tc double ambient temperature at the observer (deg C) \* \* relative humidity at the observer (range 0-1) rh double \* \* double wΓ wavelength (micrometers, Note 7) \* \* \* \* Returned: \* \* astrom iauASTROM\* star-independent astrometry parameters: \* \* pmt double unchanged \* \* double[3] eb unchanged \* \* eh double[3] unchanged \* \* em double unchanged \* \* double[3] v unchanged \* \* bm1 double unchanged \* \* double[3][3] unchanged bpn \* \* along double longitude + s' (radians) polar motion xp wrt local meridian (radians) polar motion yp wrt local meridian (radians) \* \* xpl double \* \* double ypl \* \* sphi double sine of geodetic latitude cosine of geodetic latitude magnitude of diurnal aberration vector \* \* cphi double \* \* diurab double \* \* eral double "local" Earth rotation angle (radians) \* \* refa double refraction constant A (radians) \* \* refb refraction constant B (radians) double \* \* \* \* Returned (function value): \* \* status: +1 = dubious year (Note 2) int \* \* 0 = OK \* \* -1 = unacceptable date \* \* \* \* Notes: \* \* \* \* 1) utcl+utc2 is quasi Julian Date (see Note 2), apportioned in any \* \* convenient way between the two arguments, for example where utcl \* \* is the Julian Day Number and utc2 is the fraction of a day. \* \* \* \* However, JD cannot unambiguously represent UTC during a leap \* \* second unless special measures are taken. The convention in the \* \* present function is that the JD day represents UTC days whether \* \* the length is 86399, 86400 or 86401 SI seconds. \* \* \* \* Applications should use the function iauDtf2d to convert from \* \* calendar date and time of day into 2-part quasi Julian Date, as \* \* it implements the leap-second-ambiguity convention just \* \* described.

\* \* \* \* 2) The warning status "dubious year" flags UTCs that predate the \* \* introduction of the time scale or that are too far in the future \* \* to be trusted. See iauDat for further details. \* \* \* \* 3) UT1-UTC is tabulated in IERS bulletins. It increases by exactly \* \* one second at the end of each positive UTC leap second, \* \* introduced in order to keep UT1-UTC within +/-0.9s. n.b. This \* \* practice is under review, and in the future UT1-UTC may grow \* \* essentially without limit. \* \* \* \* 4) The geographical coordinates are with respect to the WGS84 reference ellipsoid. TAKE CARE WITH THE LONGITUDE SIGN: the longitude required by the present function is east-positive \* \* the \* \* \* \* (i.e. right-handed), in accordance with geographical convention. \* \* The polar motion xp,yp can be obtained from IERS bulletins. The \* \* 5) \* \* values are the coordinates (in radians) of the Celestial \* \* Intermediate Pole with respect to the International Terrestrial \* \* Reference System (see IERS Conventions 2003), measured along the \* \* meridians 0 and 90 deg west respectively. For many applications, \* \* xp and yp can be set to zero. \* \* \* \* Internally, the polar motion is stored in a form rotated onto \* \* the local meridian. \* \* \* \* If hm, the height above the ellipsoid of the observing station 6) \* \* in meters, is not known but phpa, the pressure in hPa (=mB), is \* \* available, an adequate estimate of hm can be obtained from the \* \* expression \* \* \* \* hm = -29.3 \* tsl \* log ( phpa / 1013.25 ); \* \* \* \* where tsl is the approximate sea-level air temperature in K \* \* (See Astrophysical Quantities, C.W.Allen, 3rd edition, section 52). Similarly, if the pressure phpa is not known, it can be estimated from the height of the observing station, hm, as \* \* \* \* \* \* follows: \* \* \* \* phpa = 1013.25 \* exp ( -hm / ( 29.3 \* tsl ) ); \* \* \* \* Note, however, that the refraction is nearly proportional to the \* \* pressure and that an accurate phpa value is important for \* \* precise work. \* \* \* \* The argument wl specifies the observing wavelength in 7) \* \* micrometers. The transition from optical to radio is assumed to \* \* occur at 100 micrometers (about 3000 GHz). \* \* \* \* 8) It is advisable to take great care with units, as even unlikely values of the input parameters are accepted and processed in \* \* \* \* accordance with the models used. \* \* \* \* 9) In cases where the caller wishes to supply his own Earth \* \* rotation information and refraction constants, the function \* \* iauApc can be used instead of the present function. \* \* \* \* 10) This is one of several functions that inserts into the astrom \* \* structure star-independent parameters needed for the chain of \* \* astrometric transformations ICRS <-> GCRS <-> CIRS <-> observed. \* \* \* \* The various functions support different classes of observer and \* \* portions of the transformation chain: \* \* \* \* functions observer transformation \* \* \* \* iauApcg iauApcg13 ICRS <-> GCRS geocentric \* \* iauApci iauApci13 ICRS <-> CIRS terrestrial \* \* ICRS <-> observed iauApco iauApco13 terrestrial \* \* iauApcs iauApcs13 ICRS <-> GCRS space \* \* update Earth rotation iauAper iauAper13 terrestrial \* \* iauApio iauApio13 terrestrial CIRS <-> observed \* \*

\* \* Those with names ending in "13" use contemporary SOFA models to \* \* compute the various ephemerides. The others accept ephemerides \* \* supplied by the caller. \* \* \* \* The transformation from ICRS to GCRS covers space motion, \* \* parallax, light deflection, and aberration. From GCRS to CIRS comprises frame bias and precession-nutation. From CIRS to observed takes account of Earth rotation, polar motion, diurnal aberration and parallax (unless subsumed into the ICRS <-> GCRS \* \* \* \* \* \* \* \* transformation), and atmospheric refraction. \* \* \* \* 11) The context structure astrom produced by this function is used \* \* by iauAtiog and iauAtoiq. \* \* \* \* Called: \* \* UTC to TAI iauUtctai \* \* TAI to TT iauTaitt \* \* iauUtcut1 UTC to UT1 \* \* the TIO locator s', IERS 2000 iauSp00 Earth rotation angle, IAU 2000 refraction constants for given ambient conditions astrometry parameters, CIRS-observed \* \* iauEra00 \* \* iauRefco \* \* astrometry parameters, CIRS-observed iauApio \* \* \*/

void iauAtci13(double rc, double dc, double pr, double pd, double px, double rv, double date1, double date2, double \*ri, double \*di, double \*eo) /\* \* \* \* \* iauAtci13 \* \* \* \* \* \* Transform ICRS star data, epoch J2000.0, to CIRS. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* double ICRS right ascension at J2000.0 (radians, Note 1) rc \* \* ICRS declination at J2000.0 (radians, Note 1) dc double \* \* pr double RA proper motion (radians/year; Note 2) Dec proper motion (radians/year) \* \* pd double \* \* рx double parallax (arcsec) \* \* double radial velocity (km/s, +ve if receding) rv \* \* TDB as a 2-part... date1 double \* \* date2 double ...Julian Date (Note 3) \* \* \* \* Returned: \* \* ri,di double\* CIRS geocentric RA,Dec (radians) eo double\* equation of the origins (ERA-GST, Note 5) \* \* \* \* \* \* Notes: \* \* \* \* 1) Star data for an epoch other than J2000.0 (for example from the \* \* Hipparcos catalog, which has an epoch of J1991.25) will require a \* \* preliminary call to iauPmsafe before use. \* \* \* \* 2) The proper motion in RA is dRA/dt rather than cos(Dec)\*dRA/dt. \* \* 3) The TDB date date1+date2 is a Julian Date, apportioned in any \* \* convenient way between the two arguments. For example, JD(TDB)=2450123.7 could be expressed in any of these ways, among \* \* \* \* \* \* others: \* \* \* \* date1 date2 \* \* \* \* 2450123.7 0.0 (JD method) \* \* -1421.3 2451545.0 (J2000 method) \* \* 2400000.5 50123.2 (MJD method) \* \* 2450123.5 0.2 (date & time method) \* \* \* \* The JD method is the most natural and convenient to use in cases \* \* where the loss of several decimal digits of resolution is \* \* acceptable. The J2000 method is best matched to the way the \* \* argument is handled internally and will deliver the optimum \* \* resolution. The MJD method and the date & time methods are both \* \* good compromises between resolution and convenience. For most \* \* applications of this function the choice will not be at all \* \* critical. \* \* \* \* TT can be used instead of TDB without any significant impact on \* \* accuracy. \* \* \* \* 4) The available accuracy is better than 1 milliarcsecond, limited \* \* mainly by the precession-nutation model that is used, namely \* \* IAU 2000A/2006. Very close to solar system bodies, additional \* \* errors of up to several milliarcseconds can occur because of unmodeled light deflection; however, the Sun's contribution is taken into account, to first order. The accuracy limitations of \* \* \* \* \* \* the SOFA function  ${\tt iauEpv00}$  (used to compute Earth position and \* \* velocity) can contribute aberration errors of up to \* \* 5 microarcseconds. Light deflection at the Sun's limb is

\* \* uncertain at the 0.4 mas level. \* \* 5) Should the transformation to (equinox based) apparent place be required rather than (CIO based) intermediate place, subtract the equation of the origins from the returned right ascension: \* \* \* \* \* \* RA = RI - EO. (The iauAnp function can then be applied, as required, to keep the result in the conventional 0-2pi range.) \* \* \* \* \* \* \* \* Called: iauApcil3 astrometry parameters, ICRS-CIRS, 2013 iauAtciq quick ICRS to CIRS \* \* \* \* \* \* \*/

* *
* *
    Notes:
* *
* *
    1)
       Star data for an epoch other than J2000.0 (for example from the
        Hipparcos catalog, which has an epoch of J1991.25) will require
a preliminary call to iauPmsafe before use.
* *
* *
* *
* *
    2)
        The proper motion in RA is dRA/dt rather than cos(Dec)*dRA/dt.
* *
* *
    3) utcl+utc2 is quasi Julian Date (see Note 2), apportioned in any
* *
        convenient way between the two arguments, for example where utcl
* *
        is the Julian Day Number and utc2 is the fraction of a day.
* *
* *
        However, JD cannot unambiguously represent UTC during a leap
* *
        second unless special measures are taken. The convention in the
* *
        present function is that the JD day represents UTC days whether
* *
        the length is 86399, 86400 or 86401 SI seconds.
* *
```

| * *<br>* *<br>* *<br>* *  |     | Applications should use the function iauDtf2d to convert from<br>calendar date and time of day into 2-part quasi Julian Date, as<br>it implements the leap-second-ambiguity convention just<br>described.  |
|---|-----|--|
| * *<br>* *<br>* *<br>* *  | 4)  | The warning status "dubious year" flags UTCs that predate the introduction of the time scale or that are too far in the future to be trusted. See iauDat for further details.  |
| * *<br>* *<br>* *<br>* *<br>* *<br>* *  | 5)  | UT1-UTC is tabulated in IERS bulletins. It increases by exactly<br>one second at the end of each positive UTC leap second,<br>introduced in order to keep UT1-UTC within +/- 0.9s. n.b. This<br>practice is under review, and in the future UT1-UTC may grow<br>essentially without limit.   |
| * *<br>* *<br>* *<br>* *  | б)  | The geographical coordinates are with respect to the WGS84 reference ellipsoid. TAKE CARE WITH THE LONGITUDE SIGN: the longitude required by the present function is east-positive (i.e. right-handed), in accordance with geographical convention.  |
| * * * * * * * * *   | 7)  | The polar motion xp,yp can be obtained from IERS bulletins. The values are the coordinates (in radians) of the Celestial Intermediate Pole with respect to the International Terrestrial Reference System (see IERS Conventions 2003), measured along the meridians 0 and 90 deg west respectively. For many applications, xp and yp can be set to zero.   |
| * *<br>* *<br>* *<br>* *<br>* *   | 8)  | If hm, the height above the ellipsoid of the observing station<br>in meters, is not known but phpa, the pressure in hPa (=mB),<br>is available, an adequate estimate of hm can be obtained from<br>the expression  |
| * *<br>* *  |     | hm = -29.3 * tsl * log ( phpa / 1013.25 );   |
| <pre>     * *     * *     * *     * *     * *     * *     * *     *     * *     *</pre> |     | where tsl is the approximate sea-level air temperature in K<br>(See Astrophysical Quantities, C.W.Allen, 3rd edition, section<br>52). Similarly, if the pressure phpa is not known, it can be<br>estimated from the height of the observing station, hm, as<br>follows:  |
| * *   |     | phpa = 1013.25 * exp ( -hm / ( 29.3 * tsl ) );   |
| * *<br>* *<br>* *<br>* *  |     | Note, however, that the refraction is nearly proportional to<br>the pressure and that an accurate phpa value is important for<br>precise work.   |
| * *<br>* *<br>* *<br>* *  | 9)  | The argument wl specifies the observing wavelength in micrometers. The transition from optical to radio is assumed to occur at 100 micrometers (about 3000 GHz).   |
| * * * * * * * * *   | 10) | The accuracy of the result is limited by the corrections for refraction, which use a simple $A*tan(z) + B*tan^3(z)$ model.<br>Providing the meteorological parameters are known accurately and there are no gross local effects, the predicted observed coordinates should be within 0.05 arcsec (optical) or 1 arcsec (radio) for a zenith distance of less than 70 degrees, better than 30 arcsec (optical or radio) at 85 degrees and better than 20 arcmin (optical) or 30 arcmin (radio) at the horizon.                        |
| * *<br>* *<br>* *<br>* *<br>* *   |     | Without refraction, the complementary functions iauAtcol3 and<br>iauAtocl3 are self-consistent to better than 1 microarcsecond<br>all over the celestial sphere. With refraction included,<br>consistency falls off at high zenith distances, but is still<br>better than 0.05 arcsec at 85 degrees.   |
| * * * * * * * *   | 11) | "Observed" Az,ZD means the position that would be seen by a<br>perfect geodetically aligned theodolite. (Zenith distance is<br>used rather than altitude in order to reflect the fact that no<br>allowance is made for depression of the horizon.) This is<br>related to the observed HA,Dec via the standard rotation, using<br>the geodetic latitude (corrected for polar motion), while the<br>observed HA and RA are related simply through the Earth rotation<br>angle and the site longitude. "Observed" RA,Dec or HA,Dec thus |

| * * | means the position that would be seen by a perfect equatorial       |
|-----|---|
| * * | with its polar axis aligned to the Earth's axis of rotation.        |
| * * |   |
| * * | 12) It is advisable to take great care with units, as even unlikely |
| * * | values of the input parameters are accepted and processed in        |
| * * | accordance with the models used.                                    |

void iauAticl3(double ri, double di, double date1, double date2, double \*rc, double \*dc, double \*eo) /\* , \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* iauAtic13 \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* \* \* Transform star RA, Dec from geocentric CIRS to ICRS astrometric. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* ri, di double CIRS geocentric RA, Dec (radians) \* \* double TDB as a 2-part... date1 \* \* date2 double ...Julian Date (Note 1) \* \* \* \* Returned: \* \* rc,dc double ICRS astrometric RA,Dec (radians) \* \* eo double equation of the origins (ERA-GST, Note 4) \* \* \* \* Notes: \* \* \* \* 1) The TDB date date1+date2 is a Julian Date, apportioned in any \* \* convenient way between the two arguments. For example, \* \* JD(TDB)=2450123.7 could be expressed in any of these ways, among \* \* others: \* \* \* \* date2 date1 \* \* \* \* 2450123.7 0.0 (JD method) \* \* 2451545.0 -1421.3 (J2000 method) \* \* 2400000.5 50123.2 (MJD method) \* \* (date & time method) 2450123.5 0.2 \* \* \* \* The JD method is the most natural and convenient to use in cases \* \* where the loss of several decimal digits of resolution is \* \* acceptable. The J2000 method is best matched to the way the \* \* argument is handled internally and will deliver the optimum \* \* resolution. The MJD method and the date & time methods are both \* \* good compromises between resolution and convenience. For most \* \* applications of this function the choice will not be at all \* \* critical. \* \* \* \* TT can be used instead of TDB without any significant impact on \* \* accuracy. \* \* \* \* 2) Iterative techniques are used for the aberration and light \* \* deflection corrections so that the functions iauAtic13 (or \* \* iauAticq) and iauAtcil3 (or iauAtciq) are accurate inverses; \* \* even at the edge of the Sun's disk the discrepancy is only about \* \* 1 nanoarcsecond. \* \* \* \* 3) The available accuracy is better than 1 milliarcsecond, limited \* \* mainly by the precession-nutation model that is used, namely \* \* IAU 2000A/2006. Very close to solar system bodies, additional \* \* errors of up to several milliarcseconds can occur because of \* \* unmodeled light deflection; however, the Sun's contribution is taken into account, to first order. The accuracy limitations of \* \* \* \* the SOFA function iauEpv00 (used to compute Earth position and \* \* velocity) can contribute aberration errors of up to \* \* 5 microarcseconds. Light deflection at the Sun's limb is uncertain at the 0.4 mas level. \* \* \* \* \* \* 4) Should the transformation to (equinox based) J2000.0 mean place \* \* be required rather than (CIO based) ICRS coordinates, subtract the \* \* equation of the origins from the returned right ascension: \* \* RA = RI - EO. (The iauAnp function can then be applied, as \* \* required, to keep the result in the conventional 0-2pi range.)

                int
                         status: +1 = dubious year (Note 2)
* *
                                   0 = OK
* *
                                   -1 = unacceptable date
* *
* *
    Notes:
* *
* *
    1) utcl+utc2 is quasi Julian Date (see Note 2), apportioned in any
* *
        convenient way between the two arguments, for example where utcl
* *
         is the Julian Day Number and utc2 is the fraction of a day.
* *
* *
        However, JD cannot unambiguously represent UTC during a leap
* *
         second unless special measures are taken. The convention in the
        present function is that the JD day represents UTC days whether the length is 86399, 86400 or 86401 SI seconds.
* *
* *
* *
* *
        Applications should use the function iauDtf2d to convert from
* *
        calendar date and time of day into 2-part quasi Julian Date, as
* *
         it implements the leap-second-ambiguity convention just
* *
        described.
* *
* *
        The warning status "dubious year" flags UTCs that predate the
    2)
* *
         introduction of the time scale or that are too far in the
* *
        future to be trusted. See iauDat for further details.
* *
* *
        UT1-UTC is tabulated in IERS bulletins. It increases by exactly
    3)
        one second at the end of each positive UTC leap second, introduced in order to keep UT1-UTC within +/- 0.9s. n.b. This
* *
* *
* *
        practice is under review, and in the future UT1-UTC may grow
* *
        essentially without limit.
```

\* \* \* \* 4) The geographical coordinates are with respect to the WGS84 \* \* reference ellipsoid. TAKE CARE WITH THE LONGITUDE SIGN: the longitude required by the present function is east-positive (i.e. right-handed), in accordance with geographical convention. \* \* \* \* \* \* \* \* 5) The polar motion xp,yp can be obtained from IERS bulletins. The \* \* values are the coordinates (in radians) of the Celestial \* \* Intermediate Pole with respect to the International Terrestrial \* \* Reference System (see IERS Conventions 2003), measured along the \* \* meridians  $0^{-}$  and 90 deg west respectively. For many \* \* applications, xp and yp can be set to zero. \* \* \* \* 6) If hm, the height above the ellipsoid of the observing station \* \* in meters, is not known but phpa, the pressure in hPa (=mB), is \* \* available, an adequate estimate of hm can be obtained from the \* \* expression \* \* \* \* hm = -29.3 \* tsl \* log ( phpa / 1013.25 ); \* \* \* \* where tsl is the approximate sea-level air temperature in  $\ensuremath{\boldsymbol{K}}$ \* \* (See Astrophysical Quantities, C.W.Allen, 3rd edition, section 52). Similarly, if the pressure phpa is not known, it can be \* \* \* \* estimated from the height of the observing station,  $\ensuremath{\mathsf{hm}}$  , as \* \* follows: \* \* \* \* phpa = 1013.25 \* exp ( -hm / ( 29.3 \* tsl ) ); \* \* \* \* Note, however, that the refraction is nearly proportional to \* \* the pressure and that an accurate phpa value is important for \* \* precise work. \* \* \* \* 7) The argument wl specifies the observing wavelength in \* \* micrometers. The transition from optical to radio is assumed to \* \* occur at 100 micrometers (about 3000 GHz). \* \* \* \* 8) "Observed" Az, ZD means the position that would be seen by a \* \* perfect geodetically aligned theodolite. (Zenith distance is \* \* used rather than altitude in order to reflect the fact that no \* \* allowance is made for depression of the horizon.) This is \* \* related to the observed HA, Dec via the standard rotation, using the geodetic latitude (corrected for polar motion), while the observed HA and RA are related simply through the Earth rotation \* \* \* \* \* \* angle and the site longitude. "Observed" RA, Dec or HA, Dec thus means the position that would be seen by a perfect equatorial with its polar axis aligned to the Earth's axis of rotation. \* \* \* \* \* \* \* \* 9) The accuracy of the result is limited by the corrections for \* \* refraction, which use a simple A\*tan(z) + B\*tan^3(z) model. \* \* Providing the meteorological parameters are known accurately and there are no gross local effects, the predicted astrometric coordinates should be within 0.05 arcsec (optical) or 1 arcsec \* \* \* \* \* \* (radio) for a zenith distance of less than 70 degrees, better than 30 arcsec (optical or radio) at 85 degrees and better \* \* \* \* than 20 arcmin (optical) or 30 arcmin (radio) at the horizon. \* \* \* \* 10) The complementary functions iauAtiol3 and iauAtoil3 are self-\* \* consistent to better than 1 microarcsecond all over the \* \* celestial sphere. \* \* \* \* 11) It is advisable to take great care with units, as even unlikely \* \* values of the input parameters are accepted and processed in \* \* accordance with the models used. \* \* \* \* Called: \* \* astrometry parameters, CIRS-observed, 2013 quick CIRS to observed iauApio13 \* \* iauAtioq \* \* \*/

void iauAtioq(double ri, double di, iauASTROM \*astrom, double \*aob, double \*zob, double \*hob, double \*dob, double \*rob) \* \* \* \* iauAtioq \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* \* \* Quick CIRS to observed place transformation. \* \* Use of this function is appropriate when efficiency is important and where many star positions are all to be transformed for one date. \* \* \* \* \* \* The star-independent astrometry parameters can be obtained by \* \* calling iauApio[13] or iauApco[13]. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* ri double CIRS right ascension \* \* di double CIRS declination \* \* astrom iauASTROM\* star-independent astrometry parameters: \* \* PM time interval (SSB, Julian years) double pmt \* \* SSB to observer (vector, au) eb double[3] \* \* double[3] Sun to observer (unit vector) eh \* \* em double distance from Sun to observer (au) \* \* barycentric observer velocity (vector, c)  $sqrt(1-|v|^2)$ : reciprocal of Lorenz factor v double[3] \* \* bm1 double \* \* double[3][3] bias-precession-nutation matrix bpn \* \* along double longitude + s' (radians) \* \* polar motion xp wrt local meridian (radians) xpl double \* \* ypl polar motion yp wrt local meridian (radians) double \* \* sphi double sine of geodetic latitude \* \* double cosine of geodetic latitude cphi \* \* diurab double magnitude of diurnal aberration vector \* \* "local" Earth rotation angle (radians) eral double \* \* refa double refraction constant A (radians) \* \* refb double refraction constant B (radians) \* \* \* \* Returned: \* \* aob double\* observed azimuth (radians: N=0,E=90) \* \* double\* observed zenith distance (radians) zoh \* \* hob double\* observed hour angle (radians) \* \* dob double\* observed declination (radians) \* \* double\* observed right ascension (CIO-based, radians) rob \* \* \* \* Notes: \* \* \* \* 1) This function returns zenith distance rather than altitude in \* \* order to reflect the fact that no allowance is made for \* \* depression of the horizon. \* \* \* \* 2) The accuracy of the result is limited by the corrections for \* \* refraction, which use a simple  $A^{tan}(z) + B^{tan^{3}(z)}$  model. \* \* Providing the meteorological parameters are known accurately and \* \* there are no gross local effects, the predicted observed coordinates should be within 0.05 arcsec (optical) or 1 arcsec \* \* \* \* (radio) for a zenith distance of less than 70 degrees, better \* \* than 30 arcsec (optical or radio) at 85 degrees and better \* \* than 20 arcmin (optical) or 30 arcmin (radio) at the horizon. \* \* \* \* Without refraction, the complementary functions iauAtioq and \* \* iauAtoiq are self-consistent to better than 1 microarcsecond all \* \* over the celestial sphere. With refraction included, consistency \* \* falls off at high zenith distances, but is still better than \* \* 0.05 arcsec at 85 degrees. \* \* \* \* 3) It is advisable to take great care with units, as even unlikely \* \* values of the input parameters are accepted and processed in

\* \* accordance with the models used. \* \* \* \* 4) The CIRS RA, Dec is obtained from a star catalog mean place by \* \* allowing for space motion, parallax, the Sun's gravitational lens \* \* effect, annual aberration and precession-nutation. For star \* \* positions in the ICRS, these effects can be applied by means of \* \* the iauAtci13 (etc.) functions. Starting from classical "mean \* \* place" systems, additional transformations will be needed first. \* \* 5) "Observed" Az, El means the position that would be seen by a perfect geodetically aligned theodolite. This is obtained from \* \* \* \* \* \* the CIRS RA, Dec by allowing for Earth orientation and diurnal \* \* aberration, rotating from equator to horizon coordinates, and \* \* then adjusting for refraction. The HA, Dec is obtained by \* \* rotating back into equatorial coordinates, and is the position \* \* that would be seen by a perfect equatorial with its polar axis aligned to the Earth's axis of rotation. Finally, the RA is \* \* \* \* obtained by subtracting the HA from the local ERA. \* \* \* \* 6) The star-independent CIRS-to-observed-place parameters in ASTROM \* \* may be computed with iauApio[13] or iauApco[13]. If nothing has \* \* changed significantly except the time, iauAper[13] may be used to \* \* perform the requisite adjustment to the astrom structure. \* \* \* \* Called: \* \* iauS2c spherical coordinates to unit vector \* \* p-vector to spherical iauC2s \* \* iauAnp normalize angle into range 0 to 2pi \* \* \*/

    Notes:
* *
* *
        "Observed" Az,ZD means the position that would be seen by a
    1)
* *
        perfect geodetically aligned theodolite.
                                                     (Zenith distance is
* *
        used rather than altitude in order to reflect the fact that no
* *
        allowance is made for depression of the horizon.)
                                                               This is
* *
        related to the observed HA, Dec via the standard rotation, using
* *
        the geodetic latitude (corrected for polar motion), while the
* *
        observed HA and RA are related simply through the Earth rotation
* *
        angle and the site longitude. "Observed" RA, Dec or HA, Dec thus
* *
        means the position that would be seen by a perfect equatorial
* *
        with its polar axis aligned to the Earth's axis of rotation.
* *
* *
    2)
        Only the first character of the type argument is significant.
* *
            or "r" indicates that obl and ob2 are the observed right
        ascension and declination; "H" or "h" indicates that they are
* *
* *
        hour angle (west +ve) and declination; anything else ("A" or
* *
         "a" is recommended) indicates that obl and ob2 are azimuth
* *
        (north zero, east 90 deg) and zenith distance.
* *
* *
    3) utcl+utc2 is quasi Julian Date (see Note 2), apportioned in any
        convenient way between the two arguments, for example where utcl is the Julian Day Number and utc2 is the fraction of a day.
* *
* *
* *
* *
        However, JD cannot unambiguously represent UTC during a leap
* *
        second unless special measures are taken. The convention in the
* *
        present function is that the JD day represents UTC days whether
* *
        the length is 86399, 86400 or 86401 SI seconds.
```

\* \* Applications should use the function iauDtf2d to convert from \* \* calendar date and time of day into 2-part quasi Julian Date, as \* \* it implements the leap-second-ambiguity convention just \* \* described. \* \* \* \* The warning status "dubious year" flags UTCs that predate the 4) \* \* introduction of the time scale or that are too far in the \* \* future to be trusted. See iauDat for further details. \* \* \* \* UT1-UTC is tabulated in IERS bulletins. It increases by exactly 5) \* \* one second at the end of each positive UTC leap second, \* \* introduced in order to keep UT1-UTC within +/- 0.9s. n.b. This \* \* practice is under review, and in the future UT1-UTC may grow \* \* essentially without limit. \* \* \* \* 6) The geographical coordinates are with respect to the WGS84 \* \* reference ellipsoid. TAKE CARE WITH THE LONGITUDE SIGN: the longitude required by the present function is east-positive the \* \* \* \* (i.e. right-handed), in accordance with geographical convention. \* \* \* \* 7) The polar motion xp,yp can be obtained from IERS bulletins. The \* \* values are the coordinates (in radians) of the Celestial \* \* Intermediate Pole with respect to the International Terrestrial \* \* Reference System (see IERS Conventions 2003), measured along the \* \* meridians 0 and 90 deg west respectively. For many \* \* applications, xp and yp can be set to zero. \* \* \* \* 8) If hm, the height above the ellipsoid of the observing station \* \* in meters, is not known but phpa, the pressure in hPa (=mB), is available, an adequate estimate of hm can be obtained from the \* \* \* \* expression \* \* \* \* hm = -29.3 \* tsl \* log ( phpa / 1013.25 ); \* \* \* \* where tsl is the approximate sea-level air temperature in  $\boldsymbol{K}$ \* \* (See Astrophysical Quantities, C.W.Allen, 3rd edition, section \* \* 52). Similarly, if the pressure phpa is not known, it can be \* \* estimated from the height of the observing station, hm, as \* \* follows: \* \* \* \* phpa = 1013.25 \* exp ( -hm / ( 29.3 \* tsl ) ); \* \* \* \* Note, however, that the refraction is nearly proportional to \* \* the pressure and that an accurate phpa value is important for \* \* precise work. \* \* \* \* The argument wl specifies the observing wavelength in 9) \* \* micrometers. The transition from optical to radio is assumed to \* \* occur at 100 micrometers (about 3000 GHz). \* \* \* \* 10) The accuracy of the result is limited by the corrections for \* \* refraction, which use a simple  $A*tan(z) + B*tan^3(z)$  model. Providing the meteorological parameters are known accurately and \* \* \* \* there are no gross local effects, the predicted astrometric coordinates should be within 0.05 arcsec (optical) or 1 arcsec \* \* \* \* (radio) for a zenith distance of less than 70 degrees, better \* \* than 30 arcsec (optical or radio) at 85 degrees and better \* \* than 20 arcmin (optical) or 30 arcmin (radio) at the horizon. \* \* \* \* Without refraction, the complementary functions iauAtcol3 and \* \* iauAtoc13 are self-consistent to better than 1 microarcsecond \* \* all over the celestial sphere. With refraction included, \* \* consistency falls off at high zenith distances, but is still \* \* better than 0.05 arcsec at 85 degrees. \* \* \* \* 11) It is advisable to take great care with units, as even unlikely \* \* values of the input parameters are accepted and processed in \* \* accordance with the models used. \* \* \* \* Called: \* \* iauApco13 astrometry parameters, ICRS-observed \* \* iauAtoiq quick observed to CIRS

Similarly, if the pressure phpa is not known, it can be \* \* estimated from the height of the observing station, hm, as \* \* follows: \* \* \* \* phpa = 1013.25 \* exp ( -hm / ( 29.3 \* tsl ) ); \* \* \* \* Note, however, that the refraction is nearly proportional to \* \* the pressure and that an accurate phpa value is important for \* \* precise work. \* \* \* \* The argument wl specifies the observing wavelength in 9) \* \* micrometers. The transition from optical to radio is assumed to \* \* occur at 100 micrometers (about 3000 GHz). \* \* \* \* 10) The accuracy of the result is limited by the corrections for \* \* refraction, which use a simple  $A*tan(z) + B*tan^3(z)$  model. Providing the meteorological parameters are known accurately and \* \* \* \* there are no gross local effects, the predicted astrometric coordinates should be within 0.05 arcsec (optical) or 1 arcsec \* \* \* \* (radio) for a zenith distance of less than 70 degrees, better \* \* than 30 arcsec (optical or radio) at 85 degrees and better \* \* than 20 arcmin (optical) or 30 arcmin (radio) at the horizon. \* \* \* \* Without refraction, the complementary functions iauAtio13 and \* \* iauAtoi13 are self-consistent to better than 1 microarcsecond \* \* all over the celestial sphere. With refraction included, \* \* consistency falls off at high zenith distances, but is still \* \* better than 0.05 arcsec at 85 degrees. \* \* \* \* 12) It is advisable to take great care with units, as even unlikely \* \* values of the input parameters are accepted and processed in \* \* accordance with the models used. \* \* \* \* Called: \* \* iauApio13 astrometry parameters, CIRS-observed, 2013 \* \* iauAtoiq quick observed to CIRS

                             CIRS declination (radians)
* *
* *
    Notes:
* *
* *
    1) "Observed" Az, El means the position that would be seen by a
* *
        perfect geodetically aligned theodolite. This is related to
        the observed HA,Dec via the standard rotation, using the geodetic latitude (corrected for polar motion), while the observed HA and
* *
* *
* *
        RA are related simply through the Earth rotation angle and the
        site longitude. "Observed" RA,Dec or HA,Dec thus means the position that would be seen by a perfect equatorial with its
* *
* *
* *
        polar axis aligned to the Earth's axis of rotation. By removing
* *
        from the observed place the effects of atmospheric refraction and
* *
        diurnal aberration, the CIRS RA, Dec is obtained.
* *
     2) Only the first character of the type argument is significant.
* *
* *
        "R" or "r" indicates that obl and ob2 are the observed right
* *
        ascension and declination; "H" or "h" indicates that they are hour angle (west +ve) and declination; anything else ("A" or
* *
* *
        "a" is recommended) indicates that obl and ob2 are azimuth (north
* *
        zero, east 90 deg) and zenith distance. (Zenith distance is used rather than altitude in order to reflect the fact that no
* *
* *
        allowance is made for depression of the horizon.)
* *
* *
    3) The accuracy of the result is limited by the corrections for
* *
        refraction, which use a simple A^{tan}(z) + B^{tan^{3}(z)} model.
* *
        Providing the meteorological parameters are known accurately and
* *
        there are no gross local effects, the predicted observed coordinates should be within 0.05 arcsec (optical) or 1 arcsec
* *
```

(radio) for a zenith distance of less than 70 degrees, better than 30 arcsec (optical or radio) at 85 degrees and better than \* \* \* \* \* \* 20 arcmin (optical) or 30 arcmin (radio) at the horizon. \* \* \* \* Without refraction, the complementary functions iauAtioq and \* \* iauAtoiq are self-consistent to better than 1 microarcsecond all \* \* over the celestial sphere. With refraction included, consistency \* \* falls off at high zenith distances, but is still better than \* \* 0.05 arcsec at 85 degrees. \* \* \* \* 4) It is advisable to take great care with units, as even unlikely \* \* values of the input parameters are accepted and processed in \* \* accordance with the models used. \* \* \* \* Called: \* \* iauS2c spherical coordinates to unit vector \* \* p-vector to spherical iauC2s \* \* iauAnp normalize angle into range 0 to 2pi \* \*

\*/

void iauBi00(double \*dpsibi, double \*depsbi, double \*dra) /\* \* \* \* \* iauBi00 \* \* \* \* \* \* Frame bias components of IAU 2000 precession-nutation models (part \* \* of MHB2000 with additions). \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: canonical model. \* \* \* \* Returned: \* \* dpsibi, depsbi double longitude and obliquity corrections dra double the ICRS RA of the J2000.0 mean equinox \* \* \* \* \* \* Notes: \* \* \* \* 1) The frame bias corrections in longitude and obliquity (radians) are required in order to correct for the offset between the GCRS pole and the mean J2000.0 pole. They define, with respect to the GCRS frame, a J2000.0 mean pole that is consistent with the rest \* \* \* \* \* \* \* \* of the IAU 2000A precession-nutation model. \* \* \* \* 2) In addition to the displacement of the pole, the complete \* \* description of the frame bias requires also an offset in right \* \* ascension. This is not part of the IAU 2000A model, and is from \* \* Chapront et al. (2002). It is returned in radians. \* \* \* \* 3) This is a supplemented implementation of one aspect of the IAU \* \* 2000A nutation model, formally adopted by the IAU General \* \* Assembly in 2000, namely MHB2000 (Mathews et al. 2002). \* \* \* \* References: \* \* \* \* Chapront, J., Chapront-Touze, M. & Francou, G., Astron. \* \* Astrophys., 387, 700, 2002. \* \* \* \* Mathews, P.M., Herring, T.A., Buffet, B.A., "Modeling of nutation \* \* and precession New nutation series for nonrigid Earth and insights into the Earth's interior", J.Geophys.Res., 107, B4, 2002. The MHB2000 code itself was obtained on 9th September 2002 \* \* \* \* \* \* from ftp://maia.usno.navy.mil/conv2000/chapter5/IAU2000A. \* \* \*/

* *
* *
    Notes:
* *
* *
    1) The TT date date1+date2 is a Julian Date, apportioned in any
* *
       convenient way between the two arguments. For example,
* *
       JD(TT)=2450123.7 could be expressed in any of these ways,
* *
       among others:
* *
* *
               date1
                              date2
* *
* *
           2450123.7
                                0.0
                                           (JD method)
* *
           2451545.0
                            -1421.3
                                            (J2000 method)
* *
           2400000.5
                             50123.2
                                            (MJD method)
* *
           2450123.5
                                 0.2
                                            (date & time method)
* *
* *
       The JD method is the most natural and convenient to use in
* *
       cases where the loss of several decimal digits of resolution
* *
       is acceptable. The J2000 method is best matched to the way
* *
       the argument is handled internally and will deliver the
* *
       optimum resolution. The MJD method and the date & time methods
* *
       are both good compromises between resolution and convenience.
* *
* *
    2) The matrix rb transforms vectors from GCRS to mean J2000.0 by
* *
       applying frame bias.
* *
* *
    3) The matrix rp transforms vectors from J2000.0 mean equator and
* *
       equinox to mean equator and equinox of date by applying
* *
       precession.
* *
* *
    4) The matrix rbp transforms vectors from GCRS to mean equator and
* *
       equinox of date by applying frame bias then precession. It is
* *
       the product rp x rb.
* *
* *
    5) It is permissible to re-use the same array in the returned
* *
       arguments. The arrays are filled in the order given.

* *
* *
    Given:
* *
                  double[3][3] celestial-to-true matrix (Note 1)
       rbpn
* *
* *
    Returned:
* *
                                Celestial Intermediate Pole (Note 2)
                  double
       x,y
* *
* *
    Notes:
* *
* *
    1) The matrix rbpn transforms vectors from GCRS to true equator (and
       CIO or equinox) of date, and therefore the Celestial Intermediate
Pole unit vector is the bottom row of the matrix.
* *
* *
* *
* *
    2) The arguments x,y are components of the Celestial Intermediate
* *
       Pole unit vector in the Geocentric Celestial Reference System.
* *
* *

* *
* *
    1) This function constructs the rotation matrix that transforms
* *
       vectors in the celestial system into vectors in the terrestrial
* *
       system. It does so starting from precomputed components, namely
* *
       the matrix which rotates from celestial coordinates to the
       intermediate frame, the Earth rotation angle and the polar motion matrix. One use of the present function is when generating a
* *
* *
* *
       series of celestial-to-terrestrial matrices where only the Earth
* *
       Rotation Angle changes, avoiding the considerable overhead of
* *
       recomputing the precession-nutation more often than necessary to
* *
       achieve given accuracy objectives.
* *
* *
    2) The relationship between the arguments is as follows:
* *
* *
          [TRS] = RPOM * R_3(ERA) * rc2i * [CRS]
* *
* *
                 = rc2t * [CRS]
* *
       where [CRS] is a vector in the Geocentric Celestial Reference
* *
* *
       System and [TRS] is a vector in the International Terrestrial
* *
       Reference System (see IERS Conventions 2003).

For example, JD(UT1)=2450123.7 could be expressed in any o \* \* these ways, among others: \* \* \* \* uta utb \* \* \* \* 2450123.7 0.0 (JD method) \* \* -1421.3 2451545.0 (J2000 method) \* \* 2400000.5 50123.2 (MJD method) \* \* 2450123.5 0.2 (date & time method) \* \* \* \* The JD method is the most natural and convenient to use in \* \* cases where the loss of several decimal digits of resolution is \* \* acceptable. The J2000 and MJD methods are good compromises \* \* between resolution and convenience. In the case of uta,utb, the \* \* date & time method is best matched to the Earth rotation angle \* \* algorithm used: maximum precision is delivered when the uta argument is for Ohrs UT1 on the day in question and the utb argument lies in the range 0 to 1, or vice versa. \* \* \* \* \* \* 2) The Celestial Intermediate Pole coordinates are the x,y components of the unit vector in the Geocentric Celestial \* \* \* \* \* \* Reference System. \* \* \* \* 3) The arguments xp and yp are the coordinates (in radians) of the \* \* Celestial Intermediate Pole with respect to the International \* \* Terrestrial Reference System (see IERS Conventions 2003), \* \* measured along the meridians to 0 and 90 deg west respectively. \* \* \* \* 4) The matrix rc2t transforms from celestial to terrestrial \* \* coordinates: \* \* \* \* [TRS] = RPOM \* R\_3(ERA) \* RC2I \* [CRS] \* \* \* \* = rc2t \* [CRS] \* \* \* \* where [CRS] is a vector in the Geocentric Celestial Reference \* \* System and [TRS] is a vector in the International Terrestrial \* \* Reference System (see IERS Conventions 2003), ERA is the Earth \* \* Rotation Angle and RPOM is the polar motion matrix. \* \* \* \* 5) Although its name does not include "00", This function is in fact \* \* specific to the IAU 2000 models.

    Gregorian Calendar to Julian Date.
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards Of Fundamental Astronomy) software collection.
* *
* *
    Status: support function.
* *
* *
    Given:
* *
       iy,im,id int
                         year, month, day in Gregorian calendar (Note 1)
* *
* *
    Returned:
                  double MJD zero-point: always 2400000.5
double Modified Julian Date for 0 hrs
* *
       djm0
* *
       dim
* *
* *
    Returned (function value):
* *
                  int
                           status:
* *
                               0 = OK
* *
                              -1 = bad year
                                                (Note 3: JD not computed)
* *
                              -2 = bad month (JD not computed)
* *
                              -3 = bad day
                                                (JD computed)
* *
* *
    Notes:
* *
* *
    1) The algorithm used is valid from -4800 March 1, but this
* *
       implementation rejects dates before -4799 January 1.
* *
* *
    2) The Julian Date is returned in two pieces, in the usual SOFA
* *
       manner, which is designed to preserve time resolution. The
* *
       Julian Date is available as a single number by adding djm0 and
* *
       djm.
* *
* *
    3) In early eras the conversion is from the "Proleptic Gregorian
* *
       Calendar"; no account is taken of the date(s) of adoption of
* *
       the Gregorian Calendar, nor is the AD/BC numbering convention
* *
       observed.
* *

* *
       ihmsf
* *
* *
    Returned (function value):
* *
                         status: +1 = dubious year (Note 5)
                 int
* *
                                  0 = OK
* *
                                  -1 = unacceptable date (Note 6)
* *
* *
    Notes:
* *
* *
    1) scale identifies the time scale. Only the value "UTC" (in upper
* *
       case) is significant, and enables handling of leap seconds (see
* *
       Note 4).
* *
* *
    2) ndp is the number of decimal places in the seconds field, and can
* *
       have negative as well as positive values, such as:
* *
* *
                   resolution
       ndp
* *
                      1 00 00
       -4
* *
                      0 10 00
       -3
* *
       -2
                      0 01 00
* *
       -1
                      0 00 10
* *
                      0 00 01
        0
* *
        1
                      0 00 00.1
* *
        2
                      0 00 00.01
* *
                      0 00 00.001
        3
* *
* *
       The limits are platform dependent, but a safe range is -5 to +9.
* *
* *
    3) d1+d2 is Julian Date, apportioned in any convenient way between
       the two arguments, for example where d1 is the Julian Day Number
* *
       and d2 is the fraction of a day. In the case of UTC, where the
* *
* *
       use of JD is problematical, special conventions apply: see the
* *
       next note.
* *
* *
    4) JD cannot unambiguously represent UTC during a leap second unless
* *
       special measures are taken. The SOFA internal convention is that
* *
       the quasi-JD day represents UTC days whether the length is 86399,
* *
       86400 \mbox{ or } 86401 \mbox{ SI seconds.} In the 1960-1972 era there were
* *
       smaller jumps (in either direction) each time the linear UTC(TAI)
* *
       expression was changed, and these "mini-leaps" are also included
* *
       in the SOFA convention.
* *
* *
    5) The warning status "dubious year" flags UTCs that predate the
* *
       introduction of the time scale or that are too far in the future
* *
       to be trusted. See iauDat for further details.
* *
* *
    6) For calendar conventions and limitations, see iauCal2jd.
* *
* *
    Called:
```

| * * | iauJd2cal | JD to Gregorian calendar |
|-----|-----------|--------------------------|
| * * | iauD2tf   | decompose days to hms    |
| * * | iauDat    | delta(AT) = TAI-UTC      |
|     |           |                          |

\*\* \*/ void iauD2tf(int ndp, double days, char \*sign, int ihmsf[4]) /\* \* \* \* \* iauD2tf \* \* \* \* \* \* Decompose days to hours, minutes, seconds, fraction. \* \* This function is part of the International Astronomical Union's \* \* \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: vector/matrix support function. \* \* \* \* Given: \* \* int resolution (Note 1) ndp \* \* double interval in days days \* \* \* \* Returned: \* \* '+' or '-' char siqn \* \* int[4] hours, minutes, seconds, fraction ihmsf \* \* \* \* Notes: \* \* \* \* 1) The argument ndp is interpreted as follows: \* \* \* \* ndp resolution \* \* ...0000 00 00 : \* \* -7 1000 00 00 100 00 00 \* \* -6 \* \* 10 00 00 -5 \* \* -4 1 00 00 \* \* 0 10 00 -3 \* \* -2 0 01 00 \* \* -1 0 00 10 \* \* 0 00 01 0 \* \* 1 0 00 00.1 \* \* 2 0 00 00.01 \* \* 0 00 00.001 3 \* \* 0 00 00.000... : \* \* \* \* 2) The largest positive useful value for ndp is determined by the \* \* size of days, the format of double on the target platform, and \* \* the risk of overflowing ihmsf[3]. On a typical platform, for \* \* days up to 1.0, the available floating-point precision might \* \* correspond to ndp=12. However, the practical limit is typically ndp=9, set by the capacity of a 32-bit int, or ndp=4 if int is \* \* \* \* only 16 bits. \* \* \* \* 3) The absolute value of days may exceed 1.0. In cases where it \* \* does not, it is up to the caller to test for and handle the \* \* case where days is very nearly 1.0 and rounds up to 24 hours, \* \* by testing for ihmsf[0]=24 and setting ihmsf[0-3] to zero. \* \* \*/

int iauDat(int iy, int im, int id, double fd, double \*deltat) 11 \* \* \* \* iauDat \* \* - - - - -\* \* \* \* For a given UTC date, calculate Delta(AT) = TAI-UTC. \* \* \* \* -----: \* \* : \* \* IMPORTANT \* \* : \* \* : A new version of this function must be : \* \* : produced whenever a new leap second is : \* \* announced. There are four items to : : \* \* change on each such occasion: : • \* \* \* \* : 1) A new line must be added to the set : \* \* of statements that initialize the : : \* \* : array "changes". • \* \* : \* \* : 2) The constant IYV must be set to the : \* \* • current year. \* \* : \* \* 3) The "Latest leap second" comment : : \* \* : below must be set to the new leap : \* \* second date. : \* \* : \* \* : 4) The "This revision" comment, later, : \* \* must be set to the current date. : \* \* : : \* \* : Change (2) must also be carried out : \* \* : whenever the function is re-issued, \* \* even if no leap seconds have been : \* \* : added. • \* \* \* \* : Latest leap second: 2016 December 31 : \* \* ٠ : \* \* \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: user-replaceable support function. \* \* \* \* Given: UTC: year (Notes 1 and 2) \* \* int iy \* \* im int month (Note 2) \* \* id int day (Notes 2 and 3) \* \* fraction of day (Note 4) double fd \* \* \* \* Returned: \* \* deltat double TAI minus UTC, seconds \* \* \* \* Returned (function value): \* \* status (Note 5): int \* \* 1 = dubious year (Note 1) \* \* 0 = OK \* \* -1 = bad year \* \* -2 = bad month\* \* -3 = bad day (Note 3)\* \* -4 = bad fraction (Note 4) \* \* -5 = internal error (Note 5)\* \* \* \* Notes: \* \* 1) UTC began at 1960 January 1.0 (JD 2436934.5) and it is improper to call the function with an earlier date. If this is attempted, \* \* \* \* \* \* zero is returned together with a warning status. \* \* \* \* Because leap seconds cannot, in principle, be predicted in

\* \* advance, a reliable check for dates beyond the valid range is \* \* impossible. To guard against gross errors, a year five or more \* \* after the release year of the present function (see the constant \* \* IYV) is considered dubious. In this case a warning status is \* \* returned but the result is computed in the normal way. \* \* For both too-early and too-late years, the warning status is +1. This is distinct from the error status -1, which signifies a year \* \* \* \* \* \* so early that JD could not be computed. \* \* \* \* 2) If the specified date is for a day which ends with a leap second, \* \* the TAI-UTC value returned is for the period leading up to the leap second. If the date is for a day which begins as a leap second ends, the TAI-UTC returned is for the period following the \* \* \* \* \* \* leap second. \* \* \* \* 3) The day number must be in the normal calendar range, for example \* \* 1 through 30 for April. The "almanac" convention of allowing such dates as January 0 and December 32 is not supported in this \* \* \* \* function, in order to avoid confusion near leap seconds. \* \* \* \* 4) The fraction of day is used only for dates before the \* \* introduction of leap seconds, the first of which occurred at the \* \* end of 1971. It is tested for validity (0 to 1 is the valid \* \* range) even if not used; if invalid, zero is used and status -4 \* \* is returned. For many applications, setting fd to zero is \* \* acceptable; the resulting error is always less than 3 ms (and \* \* occurs only pre-1972). \* \* \* \* 5) The status value returned in the case where there are multiple  $% \left( {{{\boldsymbol{x}}_{i}}} \right)$ \* \* errors refers to the first error detected. For example, if the month and day are 13 and 32 respectively, status -2 (bad month) \* \* \* \* will be returned. The "internal error" status refers to a \* \* case that is impossible but causes some compilers to issue a \* \* warning. \* \* \* \* 6) In cases where a valid result is not available, zero is returned. \* \* \* \* References: \* \* \* \* 1) For dates from 1961 January 1 onwards, the expressions from the \* \* file ftp://maia.usno.navy.mil/ser7/tai-utc.dat are used. \* \* \* \* 2) The 5ms timestep at 1961 January 1 is taken from 2.58.1 (p87) of \* \* the 1992 Explanatory Supplement. \* \* \* \* Called: \* \* iauCal2jd Gregorian calendar to JD \* \* \*/

* *
* *
    Notes:
* *
* *
    1) The date date1+date2 is a Julian Date, apportioned in any
* *
       convenient way between the two arguments. For example,
* *
       JD(TT)=2450123.7 could be expressed in any of these ways,
* *
       among others:
* *
* *
              date1
                              date2
* *
* *
           2450123.7
                                 0.0
                                           (JD method)
                            -1421.3
* *
                                            (J2000 method)
           2451545.0
* *
            2400000.5
                             50123.2
                                            (MJD method)
* *
           2450123.5
                                 0.2
                                            (date & time method)
* *
* *
       The JD method is the most natural and convenient to use in
* *
       cases where the loss of several decimal digits of resolution
```

\* \* is acceptable. The J2000 method is best matched to the way the argument is handled internally and will deliver the \* \* \* \* optimum resolution. The MJD method and the date & time methods \* \* are both good compromises between resolution and convenience. \* \* \* \* Although the date is, formally, barycentric dynamical time (TDB), the terrestrial dynamical time (TT) can be used with no practical \* \* effect on the accuracy of the prediction. \* \* \* \* \* \* 2) TT can be regarded as a coordinate time that is realized as an \* \* offset of 32.184s from International Atomic Time, TAI. TT is a \* \* specific linear transformation of geocentric coordinate time TCG, \* \* which is the time scale for the Geocentric Celestial Reference \* \* System, GCRS. \* \* \* \* 3) TDB is a coordinate time, and is a specific linear transformation of barycentric coordinate time TCB, which is the time scale for \* \* \* \* the Barycentric Celestial Reference System, BCRS. \* \* \* \* 4) The difference TCG-TCB depends on the masses and positions of the \* \* bodies of the solar system and the velocity of the Earth. It is \* \* dominated by a rate difference, the residual being of a periodic \* \* character. The latter, which is modeled by the present function, \* \* comprises a main (annual) sinusoidal term of amplitude \* \* approximately 0.00166 seconds, plus planetary terms up to about 20 microseconds, and lunar and diurnal terms up to 2 microseconds. \* \* \* \* These effects come from the changing transverse Doppler effect \* \* and gravitational red-shift as the observer (on the Earth's \* \* surface) experiences variations in speed (with respect to the \* \* BCRS) and gravitational potential. \* \* \* \* 5) TDB can be regarded as the same as TCB but with a rate adjustment \* \* to keep it close to TT, which is convenient for many applications. \* \* The history of successive attempts to define TDB is set out in Resolution 3 adopted by the IAU General Assembly in 2006, which \* \* \* \* defines a fixed TDB(TCB) transformation that is consistent with \* \* contemporary solar-system ephemerides. Future ephemerides will \* \* imply slightly changed transformations between TCG and TCB, which \* \* could introduce a linear drift between TDB and TT; however, any \* \* such drift is unlikely to exceed 1 nanosecond per century. \* \* 6) The geocentric TDB-TT model used in the present function is that of Fairhead & Bretagnon (1990), in its full form. It was originally \* \* \* \* \* \* supplied by Fairhead (private communications with P.T.Wallace, \* \* 1990) as a Fortran subroutine. The present C function contains an \* \* adaptation of the Fairhead code. The numerical results are \* \* essentially unaffected by the changes, the differences with \* \* respect to the Fairhead & Bretagnon original being at the 1e-20 s \* \* level. \* \* \* \* The topocentric part of the model is from Moyer (1981) and \* \* Murray (1983), with fundamental arguments adapted from \* \* Simon et al. 1994. It is an approximation to the expression ( v / c ) . ( r / c ), where v is the barycentric velocity of the Earth, r is the geocentric position of the observer and \* \* \* \* \* \* c is the speed of light. \* \* \* \* By supplying zeroes for  $\boldsymbol{u}$  and  $\boldsymbol{v},$  the topocentric part of the \* \* model can be nullified, and the function will return the Fairhead \* \* & Bretagnon result alone. \* \* \* \* 7) During the interval 1950-2050, the absolute accuracy is better \* \* than +/- 3 nanoseconds relative to time ephemerides obtained by \* \* direct numerical integrations based on the JPL DE405 solar system \* \* ephemeris. \* \* \* \* 8) It must be stressed that the present function is merely a model, \* \* and that numerical integration of solar-system ephemerides is the \* \* definitive method for predicting the relationship between TCG and \* \* TCB and hence between TT and TDB. \* \* \* \* References: \* \*

* *
    Returned:
* *
       d1,d2
                  double 2-part Julian Date (Notes 3,4)
* *
* *
    Returned (function value):
* *
                          status: +3 = both of next two
                  int
* *
                                     +2 = time is after end of day (Note 5)
* *
                                     +1 = dubious year (Note 6)
* *
                                     0 = OK
* *
                                     -1 = bad year
* *
                                     -2 = bad month
* *
                                     -3 = bad day
* *
                                     -4 = bad hour
* *
                                    -5 = bad minute
* *
                                     -6 = \text{bad second } (<0)
* *
* *
    Notes:
* *
    1) scale identifies the time scale. Only the value "UTC" (in upper case) is significant, and enables handling of leap seconds (see
* *
* *
* *
       Note 4).
* *
* *
    2) For calendar conventions and limitations, see iauCal2jd.
* *
    3) The sum of the results, d1+d2, is Julian Date, where normally d1 is the Julian Day Number and d2 is the fraction of a day. In the
* *
* *
* *
       case of UTC, where the use of JD is problematical, special
* *
       conventions apply: see the next note.
* *
* *
    4) JD cannot unambiguously represent UTC during a leap second unless
       special measures are taken. The SOFA internal convention is that
* *
* *
       the quasi-JD day represents UTC days whether the length is 86399,
* *
       86400 or 86401 SI seconds. In the 1960-1972 era there were
* *
       smaller jumps (in either direction) each time the linear UTC(TAI)
* *
       expression was changed, and these "mini-leaps" are also included
* *
       in the SOFA convention.
* *
* *
    5) The warning status "time is after end of day" usually means that
* *
       the sec argument is greater than 60.0. However, in a day ending
* *
       in a leap second the limit changes to 61.0 (or 59.0 in the case
* *
       of a negative leap second).
* *
* *
    6) The warning status "dubious year" flags UTCs that predate the
* *
       introduction of the time scale or that are too far in the future
* *
       to be trusted. See iauDat for further details.
* *
* *
    7) Only in the case of continuous and regular time scales (TAI, TT,
* *
       TCG, TCB and TDB) is the result d1+d2 a Julian Date, strictly
* *
       speaking. In the other cases (UT1 and UTC) the result must be
* *
       used with circumspection; in particular the difference between
```

| * * | two such re | sults cannot be interpreted as a precise time |
|-----|-------------|---|
| * * | interval.   |   |
| * * |             |   |
| * * | Called:     |   |
| * * | iauCal2jd   | Gregorian calendar to JD                      |
| * * | iauDat      | delta(AT) = TAI-UTC                           |
| * * | iauJd2cal   | JD to Gregorian calendar                      |

The MJD method and the date & time methods \* \* are both good compromises between resolution and convenience. \* \* \* \* 2) The result, which is in radians, operates in the following sense: \* \* \* \* Greenwich apparent ST = GMST + equation of the equinoxes \* \* \* \* 3) The result is compatible with the IAU 2000 resolutions except \* \* that accuracy has been compromised for the sake of speed. For \* \* further details, see McCarthy & Luzum (2001), IERS Conventions \* \* 2003 and Capitaine et al. (2003). \* \* \* \* Called: \* \* IAU 2000 precession adjustments iauPr00 \* \* mean obliquity, IAU 1980 iauObl80 \* \* nutation, IAU 2000B iauNut00b \* \* iauEe00 equation of the equinoxes, IAU 2000 \* \* \* \* References: \* \* \* \* Capitaine, N., Wallace, P.T. and McCarthy, D.D., "Expressions to \* \* implement the IAU 2000 definition of UT1", Astronomy & \* \* Astrophysics, 406, 1135-1149 (2003) \* \* \* \* McCarthy, D.D. & Luzum, B.J., "An abridged model of the precession-nutation of the celestial pole", Celestial Mechanics & \* \* \* \* Dynamical Astronomy, 85, 37-49 (2003) \* \* McCarthy, D. D., Petit, G. (eds.), IERS Conventions (2003), IERS Technical Note No. 32, BKG (2004) \* \* \* \* \* \* \*/

double iauEe06a(double date1, double date2) 11 \* \* \* \* іаиЕеОба \* \* \* \* \* \* Equation of the equinoxes, compatible with IAU 2000 resolutions and \* \* IAU 2006/2000A precession-nutation. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* date1,date2 double TT as a 2-part Julian Date (Note 1) \* \* \* \* Returned (function value): \* \* equation of the equinoxes (Note 2) double \* \* \* \* Notes: \* \* \* \* 1) The TT date date1+date2 is a Julian Date, apportioned in any \* \* convenient way between the two arguments. For example, \* \* JD(TT)=2450123.7 could be expressed in any of these ways, \* \* among others: \* \* \* \* date1 date2 \* \* \* \* 2450123.7 (JD method) 0.0 -1421.3 \* \* 2451545.0 (J2000 method) \* \* 50123.2 2400000.5 (MJD method) \* \* (date & time method) 2450123.5 0.2 \* \* \* \* The JD method is the most natural and convenient to use in \* \* cases where the loss of several decimal digits of resolution \* \* is acceptable. The J2000 method is best matched to the way the argument is handled internally and will deliver the \* \* \* \* optimum resolution. The MJD method and the date & time methods \* \* are both good compromises between resolution and convenience. \* \* \* \* 2) The result, which is in radians, operates in the following sense: \* \* \* \* Greenwich apparent ST = GMST + equation of the equinoxes \* \* \* \* Called: \* \* normalize angle into range +/- pi iauAnpm \* \* Greenwich apparent sidereal time, IAU 2006/2000A iauGst06a \* \* iauGmst06 Greenwich mean sidereal time, IAU 2006 \* \* \* \* Reference: \* \* \* \* McCarthy, D. D., Petit, G. (eds.), 2004, IERS Conventions (2003), \* \* IERS Technical Note No. 32, BKG \* \* \*/

double iauEect00(double date1, double date2) 11 \* \* \* \* iauEect00 \* \* \* \* \* \* Equation of the equinoxes complementary terms, consistent with \* \* IAU 2000 resolutions. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: canonical model. \* \* \* \* Given: \* \* date1,date2 double TT as a 2-part Julian Date (Note 1) \* \* \* \* Returned (function value): \* \* double complementary terms (Note 2) \* \* \* \* Notes: \* \* \* \* 1) The TT date date1+date2 is a Julian Date, apportioned in any \* \* convenient way between the two arguments. For example, \* \* JD(TT)=2450123.7 could be expressed in any of these ways, \* \* among others: \* \* \* \* date1 date2 \* \* \* \* 2450123.7 0.0 (JD method) -1421.3 \* \* 2451545.0 (J2000 method) \* \* 2400000.5 50123.2 (MJD method) \* \* 2450123.5 0.2 (date & time method) \* \* \* \* The JD method is the most natural and convenient to use in \* \* cases where the loss of several decimal digits of resolution \* \* is acceptable. The J2000 method is best matched to the way the argument is handled internally and will deliver the \* \* \* \* optimum resolution. The MJD method and the date & time methods \* \* are both good compromises between resolution and convenience. \* \* \* \* 2) The "complementary terms" are part of the equation of the \* \* equinoxes (EE), classically the difference between apparent and \* \* mean Sidereal Time: \* \* \* \* GAST = GMST + EE\* \* \* \* with: \* \* \* \* EE = dpsi \* cos(eps)\* \* \* \* where dpsi is the nutation in longitude and eps is the obliquity \* \* of date. However, if the rotation of the Earth were constant in \* \* an inertial frame the classical formulation would lead to \* \* apparent irregularities in the UT1 timescale traceable to side-\* \* effects of precession-nutation. In order to eliminate these \* \* effects from UT1, "complementary terms" were introduced in 1994 \* \* (IAU, 1994) and took effect from 1997 (Capitaine and Gontier, \* \* 1993): \* \* \* \* GAST = GMST + CT + EE\* \* \* \* By convention, the complementary terms are included as part of \* \* the equation of the equinoxes rather than as part of the mean \* \* Sidereal Time. This slightly compromises the "geometrical" \* \* interpretation of mean sidereal time but is otherwise \* \* inconsequential. \* \* \* \* The present function computes CT in the above expression, \* \* compatible with IAU 2000 resolutions (Capitaine et al., 2002, and \* \* IERS Conventions 2003).

```
int iauEform ( int n, double *a, double *f )
/ :
* *
              _ _ _ _
* *
     iauEform
* *
* *
* *
    Earth reference ellipsoids.
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
    Status: canonical.
* *
* *
    Given:
* *
                          ellipsoid identifier (Note 1)
      n
             int
* *
* *
    Returned:
* *
            double
                          equatorial radius (meters, Note 2)
       а
* *
       f
                          flattening (Note 2)
             double
* *
* *
    Returned (function value):
* *
                          status: 0 = OK
             int
* *
                                   -1 = illegal identifier (Note 3)
* *
* *
    Notes:
* *
* *
    1) The identifier n is a number that specifies the choice of
* *
       reference ellipsoid. The following are supported:
* *
* *
                ellipsoid
          n
* *
* *
                 WGS84
           1
* *
                 GRS80
           2
* *
           3
                 WGS72
* *
* *
       The n value has no significance outside the SOFA software. For
* *
       convenience, symbols WGS84 etc. are defined in sofam.h.
* *
* *
    2) The ellipsoid parameters are returned in the form of equatorial
       radius in meters (a) and flattening (f). The latter is a number around 0.00335, i.e. around 1/298.
* *
* *
* *
* *
    3) For the case where an unsupported n value is supplied, zero a and
* *
       f are returned, as well as error status.

* *
* *
       convenient way between the two arguments. For example,
* *
       JD(TDB)=2450123.7 could be expressed in any of these ways, among
* *
       others:
* *
* *
              datel
                              date2
* *
* *
           2450123.7
                                 0.0
                                            (JD method)
* *
           2451545.0
                             -1421.3
                                            (J2000 method)
* *
            2400000.5
                             50123.2
                                            (MJD method)
* *
           2450123.5
                                 0.2
                                            (date & time method)
* *
* *
       The JD method is the most natural and convenient to use in cases
* *
       where the loss of several decimal digits of resolution is
* *
       acceptable. The J2000 method is best matched to the way the
* *
       argument is handled internally and will deliver the optimum
* *
       resolution. The MJD method and the date & time methods are both
* *
       good compromises between resolution and convenience. However,
* *
       the accuracy of the result is more likely to be limited by the
* *
       algorithm itself than the way the date has been expressed.
* *
* *
       n.b. TT can be used instead of TDB in most applications.
* *
* *
    2) On return, the arrays pvh and pvb contain the following:
* *
* *
          pvh[0][0]
                      х
* *
          pvh[0][1]
                                 heliocentric position, au
                      У
* *
          pvh[0][2] z
* *
* *
          pvh[1][0] xdot
* *
          pvh[1][1]
                      ydot
                                 heliocentric velocity, au/d
* *
          pvh[1][2]
                      zdot
* *
* *
          pvb[0][0]
                      х
* *
          pvb[0][1]
                                 barycentric position, au
                      У
* *

```
double iauEra00(double dj1, double dj2)
1:
**
* *
     iauEra00
* *
* *
* *
    Earth rotation angle (IAU 2000 model).
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards Of Fundamental Astronomy) software collection.
* *
* *
    Status: canonical model.
* *
* *
    Given:
* *
       dj1,dj2
                   double
                              UT1 as a 2-part Julian Date (see note)
* *
* *
    Returned (function value):
* *
                   double
                              Earth rotation angle (radians), range 0-2pi
* *
* *
    Notes:
* *
* *
    1) The UT1 date dj1+dj2 is a Julian Date, apportioned in any
* *
        convenient way between the arguments djl and dj2. For example, JD(UT1)=2450123.7 could be expressed in any of these ways,
* *
* *
        among others:
* *
* *
                 dj1
                                   dj2
* *
* *
             2450123.7
                                    0.0
                                                (JD method)
* *
             2451545.0
                                -1421.3
                                                (J2000 method)
* *
             2400000.5
                                50123.2
                                                (MJD method)
* *
             2450123.5
                                    0.2
                                                (date & time method)
* *
* *
        The JD method is the most natural and convenient to use in
* *
        cases where the loss of several decimal digits of resolution
* *
        is acceptable. The J2000 and MJD methods are good compromises
        between resolution and convenience. The date & time method is
best matched to the algorithm used: maximum precision is
* *
* *
* *
        delivered when the djl argument is for Ohrs UT1 on the day in
* *
        question and the dj2 argument lies in the range 0 to 1, or vice
* *
        versa.
* *
* *
    2) The algorithm is adapted from Expression 22 of Capitaine et al.
        2000. The time argument has been expressed in days directly,
* *
* *
        and, to retain precision, integer contributions have been
        eliminated. The same formulation is given in IERS Conventions (2003), Chap. 5, Eq. 14.
* *
* *

* *
    Fundamental argument, IERS Conventions (2003):
* *
* *
    mean anomaly of the Sun.
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards Of Fundamental Astronomy) software collection.
* *
* *
    Status: canonical model.
* *
* *
    Given:
* *
               double TDB, Julian centuries since J2000.0 (Note 1)
       t
* *
* *
    Returned (function value):
* *
               double l', radians (Note 2)
* *
* *
    Notes:
* *
* *
    1) Though t is strictly TDB, it is usually more convenient to use
* *
        TT, which makes no significant difference.
* *
* *
    2) The expression used is as adopted in IERS Conventions (2003) and
* *
        is from Simon et al. (1994).
* *

void iauFk425(double r1950, double d1950, double dr1950, double dd1950, double p1950, double v1950, double \*r2000, double \*d2000 double \*dr2000, double \*dd2000, double \*p2000, double \*v2000) /\* \*\* \* \* iauFk425 \* \* \_ \_ \_ \_ \_ \_ \* \* \* \* Convert B1950.0 FK4 star catalog data to J2000.0 FK5. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* This function converts a star's catalog data from the old FK4 (Bessel-Newcomb) system to the later IAU 1976 FK5 (Fricke) system. \* \* \* \* Given: (all B1950.0, FK4) \* \* \* \* r1950,d1950 double B1950.0 RA, Dec (rad) \* \* dr1950,dd1950 B1950.0 proper motions (rad/trop.yr) double \* \* p1950 double parallax (arcsec) \* \* v1950 double radial velocity (km/s, +ve = moving away) \* \* \* \* Returned: (all J2000.0, FK5) \* \* J2000.0 RA, Dec (rad) r2000,d2000 double \* \* dr2000,dd2000 J2000.0 proper motions (rad/Jul.yr) double \* \* p2000 double parallax (arcsec) \* \* v2000 double radial velocity (km/s, +ve = moving away) \* \* \* \* Notes: \* \* \* \* 1) The proper motions in RA are dRA/dt rather than cos(Dec)\*dRA/dt, \* \* and are per year rather than per century. \* \* \* \* 2) The conversion is somewhat complicated, for several reasons: \* \* \* \* . Change of standard epoch from B1950.0 to J2000.0. \* \* \* \* . An intermediate transition date of 1984 January 1.0 TT. \* \* \* \* . A change of precession model. \* \* \* \* . Change of time unit for proper motion (tropical to Julian). \* \* \* \* . FK4 positions include the E-terms of aberration, to simplify \* \* the hand computation of annual aberration. FK5 positions \* \* assume a rigorous aberration computation based on the Earth's \* \* barycentric velocity. \* \* \* \* . The E-terms also affect proper motions, and in particular cause \* \* objects at large distances to exhibit fictitious proper \* \* motions. \* \* \* \* The algorithm is based on Smith et al. (1989) and Yallop et al. (1989), which presented a matrix method due to Standish (1982) as \* \* \* \* developed by Aoki et al. (1983), using Kinoshita's development of \* \* Andoyer's post-Newcomb precession. The numerical constants from \* \* Seidelmann (1992) are used canonically. \* \* \* \* 3) Conversion from B1950.0 FK4 to J2000.0 FK5 only is provided for. \* \* Conversions for different epochs and equinoxes would require \* \* additional treatment for precession, proper motion and E-terms. \* \* \* \* 4) In the FK4 catalog the proper motions of stars within 10 degrees \* \* of the poles do not embody differential E-terms effects and should, strictly speaking, be handled in a different manner from \* \* \* \* stars outside these regions. However, given the general lack of

| * | homogeneity of the star data available for routine astrometry,<br>the difficulties of handling positions that may have been<br>determined from astrometric fields spanning the polar and non-<br>polar regions, the likelihood that the differential E-terms<br>effect was not taken into account when allowing for proper motion<br>in past astrometry, and the undesirability of a discontinuity in<br>the algorithm, the decision has been made in this SOFA algorithm<br>to include the effects of differential E-terms on the proper<br>motions for all stars, whether polar or not. At epoch J2000.0,<br>and measuring "on the sky" rather than in terms of RA change, the<br>errors resulting from this simplification are less than<br>1 milliarcsecond in position and 1 milliarcsecond per century in<br>proper motion. |  |  |

void iauFk45z(double r1950, double d1950, double bepoch, double \*r2000, double \*d2000) , \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* iauFk45z \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* \* \* Convert a B1950.0 FK4 star position to J2000.0 FK5, assuming zero \* \* proper motion in the FK5 system. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* This function converts a star's catalog data from the old FK4 \* \* (Bessel-Newcomb) system to the later IAU 1976 FK5 (Fricke) system, in such a way that the FK5 proper motion is zero. Because such a \* \* \* \* star has, in general, a non-zero proper motion in the FK4 system, the routine requires the epoch at which the position in the FK4  $\,$ \* \* \* \* system was determined. \* \* \* \* Given: \* \* r1950,d1950 B1950.0 FK4 RA, Dec at epoch (rad) double \* \* double Besselian epoch (e.g. 1979.3D0) bepoch \* \* \* \* Returned: \* \* r2000,d2000 double J2000.0 FK5 RA,Dec (rad) \* \* \* \* Notes: \* \* \* \* 1) The epoch bepoch is strictly speaking Besselian, but if a \* \* Julian epoch is supplied the result will be affected only to a \* \* negligible extent. \* \* \* \* 2) The method is from Appendix 2 of Aoki et al. (1983), but using the constants of Seidelmann (1992). See the routine iauFk425 for a general introduction to the FK4 to FK5 conversion. \* \* \* \* \* \* \* \* 3) Conversion from equinox B1950.0 FK4 to equinox J2000.0 FK5 only \* \* is provided for. Conversions for different starting and/or \* \* ending epochs would require additional treatment for precession, \* \* proper motion and E-terms. \* \* \* \* 4) In the FK4 catalog the proper motions of stars within 10 degrees of the poles do not embody differential E-terms effects and should, strictly speaking, be handled in a different manner from \* \* \* \* \* \* stars outside these regions. However, given the general lack of \* \* homogeneity of the star data available for routine astrometry, \* \* the difficulties of handling positions that may have been \* \* determined from astrometric fields spanning the polar and nonpolar regions, the likelihood that the differential E-terms effect was not taken into account when allowing for proper motion \* \* \* \* \* \* in past astrometry, and the undesirability of a discontinuity in \* \* the algorithm, the decision has been made in this SOFA algorithm \* \* to include the effects of differential E-terms on the proper \* \* motions for all stars, whether polar or not. At epoch 2000.0, \* \* and measuring "on the sky" rather than in terms of RA change, the errors resulting from this simplification are less than \* \* \* \* 1 milliarcsecond in position and 1 milliarcsecond per century in \* \* proper motion. \* \* \* \* References: \* \* \* \* Aoki, S. et al., 1983, "Conversion matrix of epoch B1950.0 \* \* FK4-based positions of stars to epoch J2000.0 positions in \* \* accordance with the new IAU resolutions". void iauFk524(double r2000, double d2000, double dr2000, double dd2000, double p2000, double v2000, double \*r1950, double \*d1950 double \*dr1950, double \*dd1950, double \*p1950, double \*v1950) /\* \* \* \* \* iauFk524 \* \* \_ \_ \_ \_ \_ \_ \* \* \* \* Convert J2000.0 FK5 star catalog data to B1950.0 FK4. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: (all J2000.0, FK5) \* \* r2000,d2000 double J2000.0 RA, Dec (rad) J2000.0 proper motions (rad/Jul.yr) \* \* dr2000,dd2000 double p2000 \* \* double parallax (arcsec) \* \* v2000 double radial velocity (km/s, +ve = moving away) \* \* \* \* Returned: (all B1950.0, FK4) \* \* B1950.0 RA,Dec (rad) r1950,d1950 double \* \* dr1950,dd1950 B1950.0 proper motions (rad/trop.yr) double p1950 \* \* double parallax (arcsec) \* \* v1950 double radial velocity (km/s, +ve = moving away) \* \* \* \* Notes: \* \* \* \* 1) The proper motions in RA are dRA/dt rather than cos(Dec)\*dRA/dt, \* \* and are per year rather than per century. \* \* \* \* 2) The conversion is somewhat complicated, for several reasons: \* \* \* \* . Change of standard epoch from J2000.0 to B1950.0. \* \* \* \* . An intermediate transition date of 1984 January 1.0 TT. \* \* \* \* . A change of precession model. \* \* \* \* . Change of time unit for proper motion (Julian to tropical). \* \* \* \* . FK4 positions include the E-terms of aberration, to simplify \* \* the hand computation of annual aberration. FK5 positions \* \* assume a rigorous aberration computation based on the Earth's \* \* barycentric velocity. \* \* \* \* . The E-terms also affect proper motions, and in particular cause \* \* objects at large distances to exhibit fictitious proper \* \* motions. \* \* \* \* The algorithm is based on Smith et al. (1989) and Yallop et al. (1989), which presented a matrix method due to Standish (1982) as \* \* \* \* developed by Aoki et al. (1983), using Kinoshita's development of \* \* Andoyer's post-Newcomb precession. The numerical constants from \* \* Seidelmann (1992) are used canonically. \* \* \* \* 4) In the FK4 catalog the proper motions of stars within 10 degrees \* \* of the poles do not embody differential E-terms effects and \* \* should, strictly speaking, be handled in a different manner from stars outside these regions. However, given the general lack of homogeneity of the star data available for routine astrometry, \* \* \* \* \* \* the difficulties of handling positions that may have been \* \* determined from astrometric fields spanning the polar and non-\* \* polar regions, the likelihood that the differential E-terms \* \* effect was not taken into account when allowing for proper motion \* \* in past astrometry, and the undesirability of a discontinuity in the algorithm, the decision has been made in this SOFA algorithm \* \*

\* \* to include the effects of differential E-terms on the proper \* \* motions for all stars, whether polar or not. At epoch J2000.0, \* \* and measuring "on the sky" rather than in terms of RA change, the errors resulting from this simplification are less than 1 milliarcsecond in position and 1 milliarcsecond per century in \* \* \* \* \* \* proper motion. \* \* \* \* Called: \* \* normalize angle into range 0 to 2pi iauAnp \* \* iauPdp scalar product of two p-vectors \* \* modulus of p-vector iauPm \* \* iauPmp p-vector minus p-vector \* \* p-vector pluus p-vector iauPpp \* \* pv-vector to spherical coordinates iauPv2s \* \* iauS2pv spherical coordinates to pv-vector \* \* iauSxp multiply p-vector by scalar \* \* \* \* References: \* \* Aoki, S. et al., 1983, "Conversion matrix of epoch B1950.0 FK4-based positions of stars to epoch J2000.0 positions in \* \* \* \* \* \* accordance with the new IAU resolutions". /*
* *
* *
    iauFk54z
* *
    _ _ _ _ _ _ _ _ _ _
* *
* *
    Convert a J2000.0 FK5 star position to B1950.0 FK4, assuming zero
* *
    proper motion in FK5 and parallax.
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
    Status: support function.
* *
* *
    Given:
* *
       r2000,d2000
                      double
                                J2000.0 FK5 RA, Dec (rad)
* *
                      double
                               Besselian epoch (e.g. 1950.0)
       bepoch
* *
* *
    Returned:
       r1950,d1950
* *
                       double
                                B1950.0 FK4 RA, Dec (rad) at epoch BEPOCH
* *
       dr1950,dd1950 double
                               B1950.0 FK4 proper motions (rad/trop.yr)
* *
* *
    Notes:
* *
* *
    1) In contrast to the iauFk524 routine, here the FK5 proper
* *
       motions, the parallax and the radial velocity are presumed zero.
* *
* *
    2) This function converts a star position from the IAU 1976 FK5
* *
      (Fricke) system to the former FK4 (Bessel-Newcomb) system, for
* *
       cases such as distant radio sources where it is presumed there is
* *
       zero parallax and no proper motion. Because of the E-terms of
* *
       aberration, such objects have (in general) non-zero proper motion
* *
       in FK4, and the present routine returns those fictitious proper
* *
       motions.
* *
* *
    3) Conversion from B1950.0 FK4 to J2000.0 FK5 only is provided for.
* *
       Conversions involving other equinoxes would require additional
* *
       treatment for precession.
* *
* *
    4) The position returned by this routine is in the B1950.0 FK4
* *
       reference system but at Besselian epoch BEPOCH. For comparison
* *
       with catalogs the BEPOCH argument will frequently be 1950.0. (In
* *
       this context the distinction between Besselian and Julian epoch
* *
       is insignificant.)
* *
* *
    5) The RA component of the returned (fictitious) proper motion is
* *
       dRA/dt rather than cos(Dec)*dRA/dt.
* *
* *

    iauFk5hip
* *
       - - - - - - -
* *
* *
    FK5 to Hipparcos rotation and spin.
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards Of Fundamental Astronomy) software collection.
* *
* *
    Status: support function.
* *
* *
    Returned:
* *
      r5h double[3][3] r-matrix: FK5 rotation wrt Hipparcos (Note 2)
* *
       s5h
              double[3]
                           r-vector: FK5 spin wrt Hipparcos (Note 3)
* *
* *
    Notes:
* *
* *
    1) This function models the FK5 to Hipparcos transformation as a
* *
       pure rotation and spin; zonal errors in the FK5 catalogue are
* *
       not taken into account.
* *
* *
    2) The r-matrix r5h operates in the sense:
* *
* *
              P_{Hipparcos} = r5h \times P_{FK5}
* *
* *
       where \texttt{P}\_\texttt{FK5} is a p-vector in the <code>FK5</code> frame, and <code>P_Hipparcos</code> is
* *
       the equivalent Hipparcos p-vector.
* *
* *
    3) The r-vector s5h represents the time derivative of the FK5 to
* *
       Hipparcos rotation. The units are radians per year (Julian,
* *
       TDB).
* *
* *
    Called:
* *
       iauRv2m

```

void iauFk5hz(double r5, double d5, double date1, double date2, double \*rh, double \*dh) /\* , \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* iauFk5hz \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* \* \* Transform an FK5 (J2000.0) star position into the system of the \* \* Hipparcos catalogue, assuming zero Hipparcos proper motion. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* double FK5 RA (radians), equinox J2000.0, at date r5 FK5 Dec (radians), equinox J2000.0, at date \* \* d5 double \* \* date1,date2 double TDB date (Notes 1,2) \* \* \* \* Returned: double \* \* rh Hipparcos RA (radians) \* \* dh double Hipparcos Dec (radians) \* \* \* \* Notes: \* \* \* \* 1) This function converts a star position from the FK5 system to \* \* the Hipparcos system, in such a way that the Hipparcos proper \* \* motion is zero. Because such a star has, in general, a non-zero \* \* proper motion in the FK5 system, the function requires the date \* \* at which the position in the FK5 system was determined. \* \* \* \* 2) The TT date date1+date2 is a Julian Date, apportioned in any convenient way between the two arguments. For example, \* \* \* \* JD(TT)=2450123.7 could be expressed in any of these ways, \* \* among others: \* \* \* \* date2 date1 \* \* \* \* 2450123.7 0.0 (JD method) \* \* -1421.3 2451545.0 (J2000 method) \* \* 2400000.5 50123.2 (MJD method) \* \* 2450123.5 0.2 (date & time method) \* \* \* \* The JD method is the most natural and convenient to use in cases where the loss of several decimal digits of resolution is acceptable. The J2000 method is best matched to the way \* \* \* \* \* \* the argument is handled internally and will deliver the \* \* optimum resolution. The MJD method and the date & time methods \* \* are both good compromises between resolution and convenience. \* \* \* \* 3) The FK5 to Hipparcos transformation is modeled as a pure \* \* rotation and spin; zonal errors in the FK5 catalogue are not \* \* taken into account. \* \* \* \* 4) The position returned by this function is in the Hipparcos \* \* reference system but at date date1+date2. \* \* \* \* 5) See also iauFk52h, iauH2fk5, iauHfk5z. \* \* \* \* Called: \* \* iauS2c spherical coordinates to unit vector \* \* iauFk5hip FK5 to Hipparcos rotation and spin multiply p-vector by scalar r-vector to r-matrix \* \* iauSxp \* \* iauRv2m \* \* product of transpose of r-matrix and p-vector iauTrxp \* \* vector product of two p-vectors iauPxp \* \* iauC2s p-vector to spherical \* \* normalize angle into range 0 to 2pi iauAnp \* \* \* \* Reference:

       eps
* *
* *
    Returned:
* *
                 double[3][3] rotation matrix
       r
* *
* *
    Notes:
* *
* *
    1) Naming the following points:
* *
* *
              e = J2000.0 ecliptic pole,
* *
             p = GCRS pole,
* *
              E = ecliptic pole of date,
* *
       and
             P = CTP.
* *
* *
       the four Fukushima-Williams angles are as follows:
* *
* *
          gamb = gamma = epE
* *
          phib = phi = pE
* *
          psi = psi = pEP
* *
          eps = epsilon = EP
* *
* *
    2) The matrix representing the combined effects of frame bias,
* *
       precession and nutation is:
* *
* *
          NxPxB = R_1(-eps).R_3(-psi).R_1(phib).R_3(gamb)
* *
* *
    3) Three different matrices can be constructed, depending on the
* *
       supplied angles:
* *
* *
       o To obtain the nutation x precession x frame bias matrix,
* *
          generate the four precession angles, generate the nutation
* *
          components and add them to the psi_bar and epsilon_A angles,
* *
          and call the present function.
* *
* *
       o To obtain the precession x frame bias matrix, generate the
* *
          four precession angles and call the present function.
* *
* *
       o To obtain the frame bias matrix, generate the four precession
* *
          angles for date J2000.0 and call the present function.
* *
* *
       The nutation-only and precession-only matrices can if necessary
* *
       be obtained by combining these three appropriately.

* *
       dd
               double
                             ICRS declination (radians)
* *
* *
    Notes:
* *
* *
    1) The IAU 1958 system of Galactic coordinates was defined with
* *
       respect to the now obsolete reference system FK4 B1950.0. When
* *
       interpreting the system in a modern context, several factors have
* *
       to be taken into account:
* *
* *
        . The inclusion in FK4 positions of the E-terms of aberration.
* *
* *
        . The distortion of the FK4 proper motion system by differential
* *
          Galactic rotation.
* *
* *
       . The use of the B1950.0 equinox rather than the now-standard
* *
          J2000.0.
* *
* *
        . The frame bias between ICRS and the J2000.0 mean place system.
* *
* *
       The Hipparcos Catalogue (Perryman & ESA 1997) provides a rotation
* *
       matrix that transforms directly between ICRS and Galactic
* *
       coordinates with the above factors taken into account. The
* *
       matrix is derived from three angles, namely the ICRS coordinates
       of the Galactic pole and the longitude of the ascending node of
the galactic equator on the ICRS equator. They are given in
* *
* *
* *
       degrees to five decimal places and for canonical purposes are
       regarded as exact. In the Hipparcos Catalogue the matrix elements are given to 10 decimal places (about 20 microarcsec).
* *
* *
* *
       In the present SOFA function the matrix elements have been
* *
       recomputed from the canonical three angles and are given to 30
* *
       decimal places.
* *
* *
    2) The inverse transformation is performed by the function iauIcrs2q.
* *
* *
    Called:
* *

    This function is part of the International Astronomical Union's
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
    Status: canonical transformation.
* *
* *
    Given:
* *
               int
                          ellipsoid identifier (Note 1)
       n
               double[3] geocentric vector (Note 2)
* *
       xyz
* *
* *
    Returned:
* *
      elong
               double
                           longitude (radians, east +ve, Note 3)
* *
       phi
               double
                           latitude (geodetic, radians, Note 3)
* *
       height double
                           height above ellipsoid (geodetic, Notes 2,3)
* *
* *
    Returned (function value):
* *
                         status: 0 = OK
              int
* *
                                    -1 = illegal identifier (Note 3)
* *
                                    -2 = internal error (Note 3)
* *
* *
   Notes:
* *
    1) The identifier n is a number that specifies the choice of
* *
* *
      reference ellipsoid. The following are supported:
* *
* *
          n
               ellipsoid
* *
* *
                WGS84
          1
* *
                GRS80
          2
* *
          3
                WGS72
* *
* *
       The n value has no significance outside the SOFA software. For
* *
       convenience, symbols WGS84 etc. are defined in sofam.h.
* *
* *
    2) The geocentric vector (xyz, given) and height (height, returned)
* *
       are in meters.
* *
* *
    3) An error status -1 means that the identifier n is illegal. An
* *
       error status -2 is theoretically impossible. In all error cases,
* *
       all three results are set to -1e9.
* *
* *
    4) The inverse transformation is performed in the function iauGd2gc.
* *
* *
    Called:
* *

                int
* *
                                     -1 = illegal f
* *
                                     -2 = illegal a
* *
* *
    Notes:
* *
* *
    1) This function is based on the GCONV2H Fortran subroutine by
* *
       Toshio Fukushima (see reference).
* *
* *
    2) The equatorial radius, a, can be in any units, but meters is
* *
       the conventional choice.
* *
* *
    3) The flattening, f, is (for the Earth) a value around 0.00335,
* *
       i.e. around 1/298.
* *
* *
    4) The equatorial radius, a, and the geocentric vector, xyz,
       must be given in the same units, and determine the units of the returned height, height.
* *
* *
* *
* *
    5) If an error occurs (status < 0), elong, phi and height are
* *
       unchanged.
* *
* *
    6) The inverse transformation is performed in the function
* *
       iauGd2gce.
* *
* *
    7) The transformation for a standard ellipsoid (such as WGS84) can
* *
       more conveniently be performed by calling iauGc2gd, which uses a
* *
       numerical code to identify the required A and F values.
* *
* *

                double xyz[3] )
/*
**
    _ _ _ _ _ _ _ _ _ _
* *
     iauGd2qc
* *
    _ _ _ _ _ _ _ _ _
* *
* *
    Transform geodetic coordinates to geocentric using the specified
* *
    reference ellipsoid.
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
    Status: canonical transformation.
* *
* *
    Given:
* *
                            ellipsoid identifier (Note 1)
       n
                int
* *
       elong
              double
                            longitude (radians, east +ve)
* *
       phi
                double
                            latitude (geodetic, radians, Note 3)
* *
       height double
                            height above ellipsoid (geodetic, Notes 2,3)
* *
* *
    Returned:
* *
                double[3] geocentric vector (Note 2)
       xyz
* *
* *
    Returned (function value):
* *
                int
                         status: 0 = OK
* *
                                     -1 = illegal identifier (Note 3)
                                     -2 = illegal case (Note 3)
* *
* *
* *
    Notes:
* *
* *
    1) The identifier n is a number that specifies the choice of
* *
       reference ellipsoid. The following are supported:
* *
* *
          n
                ellipsoid
* *
* *
                 WGS84
           1
* *
           2
                 GRS80
* *
                 WGS72
           3
* *
* *
       The n value has no significance outside the SOFA software. For
* *
       convenience, symbols WGS84 etc. are defined in sofam.h.
* *
* *
    2) The height (height, given) and the geocentric vector (xyz,
* *
       returned) are in meters.
* *
* *
    3) No validation is performed on the arguments elong, phi and
* *
       height. An error status -1 means that the identifier n is illegal. An error status -2 protects against cases that would
* *
* *
       lead to arithmetic exceptions. In all error cases, xyz is set
* *
       to zeros.
* *
* *
    4) The inverse transformation is performed in the function iauGc2gd.
* *
* *
    Called:
* *
       iauEform
                     Earth reference ellipsoids
* *
       iauGd2gce
                   geodetic to geocentric transformation, general
* *
       iauZp
                     zero p-vector
* *
*/
```

```
int iauGd2gce ( double a, double f, double elong, double phi,
                 double height, double xyz[3] )
,
* *
    _ _ _ _ _ _ _ _ _ _ _
* *
    iauGd2gce
* *
    _ _ _ _ _ _ _ _ _ .
* *
* *
    Transform geodetic coordinates to geocentric for a reference
* *
    ellipsoid of specified form.
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
    Status: support function.
* *
* *
    Given:
* *
                double
                            equatorial radius (Notes 1,4)
       а
* *
       f
                double
                            flattening (Notes 2,4)
* *
       elong
                double
                            longitude (radians, east +ve)
* *
       phi
                double
                            latitude (geodetic, radians, Note 4)
                           height above ellipsoid (geodetic, Notes 3,4)
* *
       height double
* *
* *
    Returned:
* *
       XVZ
               double[3] geocentric vector (Note 3)
* *
* *
    Returned (function value):
* *
                         status: 0 = OK
               int
* *
                                    -1 = illegal case (Note 4)
* *
    Notes:
* *
* *
    1) The equatorial radius, a, can be in any units, but meters is
* *
       the conventional choice.
* *
* *
    2) The flattening, f, is (for the Earth) a value around 0.00335,
* *
       i.e. around 1/298.
* *
* *
    3) The equatorial radius, a, and the height, height, must be
* *
       given in the same units, and determine the units of the
* *
       returned geocentric vector, xyz.
* *
* *
    4) No validation is performed on individual arguments. The error
* *
       status -1 protects against (unrealistic) cases that would lead
* *
       to arithmetic exceptions. If an error occurs, xyz is unchanged.
* *
* *
    5) The inverse transformation is performed in the function
* *
       iauGc2qde.
* *
* *
    6) The transformation for a standard ellipsoid (such as WGS84) can
* *
       more conveniently be performed by calling iauGd2gc, which uses a
* *
       numerical code to identify the required a and \ensuremath{\mathsf{f}} values.

For example, JD=2450123.7 could be expressed in \* \* any of these ways, among others: \* \* \* \* Part A Part B \* \* \* \* 2450123.7 0.0 (JD method) -1421.3 \* \* (J2000 method) 2451545.0 \* \* 50123.2 2400000.5 (MJD method) \* \* 2450123.5 0.2 (date & time method) \* \* \* \* The JD method is the most natural and convenient to use in \* \* cases where the loss of several decimal digits of resolution \* \* is acceptable (in the case of UT; the TT  $\bar{\rm is}$  not at all critical \* \* in this respect). The J2000 and MJD methods are good compromises between resolution and convenience. For UT, the date & time method is best matched to the algorithm that is used by the Earth rotation angle function, called internally: maximum precision is \* \* \* \* \* \* \* \* delivered when the uta argument is for Ohrs UT1 on the day in \* \* question and the utb argument lies in the range 0 to 1, or vice \* \* versa. \* \* 2) Both UT1 and TT are required, UT1 to predict the Earth rotation and TT to predict the effects of precession. If UT1 is used for \* \* \* \* \* \* both purposes, errors of order 100 microarcseconds result. \* \* \* \* 3) This GMST is compatible with the IAU 2006 precession and must not \* \* be used with other precession models. \* \* \* \* 4) The result is returned in the range 0 to 2pi. \* \* \* \* Called: \* \* Earth rotation angle, IAU 2000 iauEra00 \* \* iauAnp normalize angle into range 0 to 2pi \* \* \* \* Reference: \* \* \* \* Capitaine, N., Wallace, P.T. & Chapront, J., 2005, \* \* Astron.Astrophys. 432, 355 \* \* \*/

double iauGmst82(double dj1, double dj2) \* \* \_ \_ \_ \_ \_ \_ \* \* iauGmst82 \* \* \* \* \* \* Universal Time to Greenwich mean sidereal time (IAU 1982 model). \* \* This function is part of the International Astronomical Union's \* \* \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: canonical model. \* \* \* \* Given: \* \* dj1,dj2 double UT1 Julian Date (see note) \* \* \* \* Returned (function value): \* \* double Greenwich mean sidereal time (radians) \* \* \* \* Notes: \* \* \* \* 1) The UT1 date dj1+dj2 is a Julian Date, apportioned in any \* \* convenient way between the arguments djl and dj2. For example, JD(UT1)=2450123.7 could be expressed in any of these ways, \* \* \* \* among others: \* \* \* \* dj1 dj2 \* \* \* \* 2450123.7 Ο (JD method) \* \* 2451545 -1421.3 (J2000 method) \* \* 2400000.5 50123.2 (MJD method) \* \* 2450123.5 0.2 (date & time method) \* \* \* \* The JD method is the most natural and convenient to use in \* \* cases where the loss of several decimal digits of resolution \* \* is acceptable. The J2000 and MJD methods are good compromises between resolution and convenience. The date & time method is best matched to the algorithm used: maximum accuracy (or, at \* \* \* \* \* \* least, minimum noise) is delivered when the djl argument is for \* \* Ohrs UT1 on the day in question and the dj2 argument lies in the \* \* range 0 to 1, or vice versa. \* \* 2) The algorithm is based on the IAU 1982 expression. This is always described as giving the GMST at 0 hours UT1. In fact, it \* \* \* \* \* \* gives the difference between the GMST and the UT, the steady \* \* 4-minutes-per-day drawing-ahead of ST with respect to UT. When \* \* whole days are ignored, the expression happens to equal the GMST \* \* at 0 hours UT1 each day. \* \* \* \* 3) In this function, the entire UT1 (the sum of the two arguments \* \* dj1 and dj2) is used directly as the argument for the standard formula, the constant term of which is adjusted by 12 hours to take account of the noon phasing of Julian Date. The UT1 is then \* \* \* \* \* \* added, but omitting whole days to conserve accuracy. \* \* \* \* Called: \* \* iauAnp normalize angle into range 0 to 2pi \* \* \* \* References: \* \* \* \* Transactions of the International Astronomical Union, \* \* XVIII B, 67 (1983). \* \* \* \* Aoki et al., Astron.Astrophys., 105, 359-361 (1982). \* \* \* /

double iauGst00a(double uta, double utb, double tta, double ttb) \* \* \* \* i a u G s t O O a \* \* \* \* \* \* Greenwich apparent sidereal time (consistent with IAU 2000 \* \* resolutions). \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: canonical model. \* \* \* \* Given: \* \* UT1 as a 2-part Julian Date (Notes 1,2) uta,utb double \* \* tta,ttb double TT as a 2-part Julian Date (Notes 1,2) \* \* \* \* Returned (function value): \* \* double Greenwich apparent sidereal time (radians) \* \* \* \* Notes: \* \* \* \* 1) The UT1 and TT dates uta+utb and tta+ttb respectively, are both \* \* Julian Dates, apportioned in any convenient way between the \* \* argument pairs.        Julian Dates, apportioned in any convenient way between the
* *
       argument pairs. For example, JD=2450123.7 could be expressed in
* *
       any of these ways, among others:
* *
* *
               Part A
                              Part B
* *
* *
            2450123.7
                                  0.0
                                             (JD method)
* *
            2451545.0
                              -1421.3
                                             (J2000 method)
* *
            2400000.5
                              50123.2
                                             (MJD method)
* *
            2450123.5
                                  0.2
                                             (date & time method)
* *
* *
       The JD method is the most natural and convenient to use in
* *
       cases where the loss of several decimal digits of resolution
* *
       is acceptable (in the case of UT; the TT is not at all critical
       in this respect). The J2000 and MJD methods are good compromises between resolution and convenience. For UT, the date & time
* *
* *
* *
       method is best matched to the algorithm that is used by the Earth
       rotation angle function, called internally: maximum precision is delivered when the uta argument is for Ohrs UT1 on the day in
* *
* *
* *
       question and the utb argument lies in the range 0 to 1, or vice
* *
       versa.
* *
* *
    2) Both UT1 and TT are required, UT1 to predict the Earth rotation
* *
       and TT to predict the effects of precession-nutation. If UT1 is
* *
       used for both purposes, errors of order 100 microarcseconds
* *
       result.
* *
    3) Although the function uses the IAU 2006 series for s+XY/2, it is
* *
* *
       otherwise independent of the precession-nutation model and can in
* *
       practice be used with any equinox-based NPB matrix.
* *
* *
    4) The result is returned in the range 0 to 2pi.
* *
* *
    Called:
* *

void iauHd2ae (double ha, double dec, double phi, double \*az, double \*el) /\* , \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* iauHd2ae \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* \* \* Equatorial to horizon coordinates: transform hour angle and \* \* declination to azimuth and altitude. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* double hour angle (local) ha \* \* declination dec double \* \* double site latitude phi \* \* \* \* Returned: \* \* \*az double azimuth \* \* \*el double altitude (informally, elevation) \* \* \* \* Notes: \* \* \* \* 1) All the arguments are angles in radians. \* \* \* \* 2) Azimuth is returned in the range 0-2pi; north is zero, and east \* \* is +pi/2. Altitude is returned in the range +/- pi/2. \* \* \* \* 3) The latitude phi is pi/2 minus the angle between the Earth's \* \* rotation axis and the adopted zenith. In many applications it \* \* will be sufficient to use the published geodetic latitude of the \* \* site. In very precise (sub-arcsecond) applications, phi can be \* \* corrected for polar motion. \* \* \* \* 4) The returned azimuth az is with respect to the rotational north pole, as opposed to the ITRS pole, and for sub-arcsecond accuracy will need to be adjusted for polar motion if it is to be with respect to north on a map of the Earth's surface. \* \* \* \* \* \* \* \* \* \* 5) Should the user wish to work with respect to the astronomical \* \* zenith rather than the geodetic zenith, phi will need to be \* \* adjusted for deflection of the vertical (often tens of \* \* arcseconds), and the zero point of the hour angle ha will also \* \* be affected. \* \* \* \* 6) The transformation is the same as Vh = Rz(pi)\*Ry(pi/2-phi)\*Ve, \* \* where Vh and Ve are lefthanded unit vectors in the (az,el) and \* \* (ha,dec) systems respectively and Ry and Rz are rotations about \* \* first the y-axis and then the z-axis. (n.b. Rz(pi) simply \* \* reverses the signs of the x and y components.) For efficiency, \* \* the algorithm is written out rather than calling other utility functions. For applications that require even greater efficiency, additional savings are possible if constant terms \* \* \* \* \* \* such as functions of latitude are computed once and for all. \* \* \* \* 7) Again for efficiency, no range checking of arguments is carried \* \* out. \* \* \* \* Last revision: 2017 September 12 \* \* \* \* SOFA release 2019-07-22 \* \* \* \* Copyright (C) 2019 IAU SOFA Board. * *
    CONDITIONS WHICH APPLY TO ITS USE.
* *
* *
    1. The Software is owned by the IAU SOFA Board ("SOFA").
* *
* *
    2. Permission is granted to anyone to use the SOFA software for any
* *
       purpose, including commercial applications, free of charge and
* *
       without payment of royalties, subject to the conditions and
* *
       restrictions listed below.
* *
* *
    3. You (the user) may copy and distribute SOFA source code to others,
       and use and adapt its code and algorithms in your own software,
* *
       on a world-wide, royalty-free basis. That portion of your distribution that does not consist of intact and unchanged copies
* *
* *
       of SOFA source code files is a "derived work" that must comply
* *
* *
       with the following requirements:
* *
* *
       a) Your work shall be marked or carry a statement that it
* *
           (i) uses routines and computations derived by you from
* *
           software provided by SOFA under license to you; and
* *
           (ii) does not itself constitute software provided by and/or
* *
           endorsed by SOFA.
* *
       b) The source code of your derived work must contain descriptions
* *
           of how the derived work is based upon, contains and/or differs
* *
* *
           from the original SOFA software.
* *
       c) The names of all routines in your derived work shall not
include the prefix "iau" or "sofa" or trivial modifications
* *
* *
* *
           thereof such as changes of case.
* *
* *
       d) The origin of the SOFA components of your derived work must
* *
          not be misrepresented; you must not claim that you wrote the original software, nor file a patent application for SOFA
* *
* *
           software or algorithms embedded in the SOFA software.
* *
* *
       e) These requirements must be reproduced intact in any source
* *
          distribution and shall apply to anyone to whom you have
* *
           granted a further right to modify the source code of your
* *
          derived work.
```

\* \* \* \* Note that, as originally distributed, the SOFA software is \* \* intended to be a definitive implementation of the IAU standards, \* \* and consequently third-party modifications are discouraged. All \* \* variations, no matter how minor, must be explicitly marked as \* \* such, as explained above. \* \* \* \* 4. You shall not cause the SOFA software to be brought into \* \* disrepute, either by misuse, or use for inappropriate tasks, or \* \* by inappropriate modification. \* \* \* \* 5. The SOFA software is provided "as is" and SOFA makes no warranty \* \* as to its use or performance. SOFA does not and cannot warrant \* \* the performance or results which the user may obtain by using the \* \* SOFA software. * *
* *
    іаиНd 2 ра
* *
          _ _ _
* *
* *
   Parallactic angle for a given hour angle and declination.
* *
    This function is part of the International Astronomical Union's
* *
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
   Status: support function.
* *
* *
    Given:
* *
             double
                        hour angle
      ha
* *
             double
                        declination
       dec
* *
      phi
              double
                         site latitude
* *
* *
   Returned (function value):
* *
              double
                       parallactic angle
* *
* *
   Notes:
* *
* *
    1) All the arguments are angles in radians.
* *
* *
    2)
       The parallactic angle at a point in the sky is the position
* *
        angle of the vertical, i.e. the angle between the directions to
* *
        the north celestial pole and to the zenith respectively.
* *
* *
    3) The result is returned in the range -pi to +pi.
* *
* *
    4) At the pole itself a zero result is returned.
* *
* *
    5) The latitude phi is pi/2 minus the angle between the Earth's
* *
        rotation axis and the adopted zenith. In many applications it
* *
        will be sufficient to use the published geodetic latitude of the
* *
        site. In very precise (sub-arcsecond) applications, phi can be
* *
        corrected for polar motion.
* *
* *
    6) Should the user wish to work with respect to the astronomical
* *
        zenith rather than the geodetic zenith, phi will need to be
* *
        adjusted for deflection of the vertical (often tens of
* *
        arcseconds), and the zero point of the hour angle ha will also
* *
       be affected.
* *

Permission is granted to anyone to use the SOFA software for any purpose, including commercial applications, free of charge and \* \* \* \* without payment of royalties, subject to the conditions and \* \* restrictions listed below. \* \* \* \* 3. You (the user) may copy and distribute SOFA source code to others, and use and adapt its code and algorithms in your own software, \* \* \* \* on a world-wide, royalty-free basis. That portion of your distribution that does not consist of intact and unchanged copies of SOFA source code files is a "derived work" that must comply \* \* \* \* \* \* with the following requirements: \* \* \* \* a) Your work shall be marked or carry a statement that it \* \* (i) uses routines and computations derived by you from \* \* software provided by SOFA under license to you; and (ii) does not itself constitute software provided by and/or \* \* \* \* endorsed by SOFA. \* \* \* \* b) The source code of your derived work must contain descriptions \* \* of how the derived work is based upon, contains and/or differs \* \* from the original SOFA software. \* \* \* \* c) The names of all routines in your derived work shall not \* \* include the prefix "iau" or "sofa" or trivial modifications \* \* thereof such as changes of case. \* \* \* \* d) The origin of the SOFA components of your derived work must \* \* not be misrepresented; you must not claim that you wrote the \* \* original software, nor file a patent application for SOFA \* \* software or algorithms embedded in the SOFA software. \* \* \* \* e) These requirements must be reproduced intact in any source \* \* distribution and shall apply to anyone to whom you have \* \* granted a further right to modify the source code of your \* \* derived work. \* \* \* \* Note that, as originally distributed, the SOFA software is \* \* intended to be a definitive implementation of the IAU standards, and consequently third-party modifications are discouraged. All \* \* \* \* variations, no matter how minor, must be explicitly marked as \* \* such, as explained above. \* \* \* \* 4. You shall not cause the SOFA software to be brought into \* \* disrepute, either by misuse, or use for inappropriate tasks, or \* \* by inappropriate modification. \* \* \* \* 5. The SOFA software is provided "as is" and SOFA makes no warranty \* \* as to its use or performance. SOFA does not and cannot warrant \* \* the performance or results which the user may obtain by using the \* \* SOFA software. SOFA makes no warranties, express or implied, as \* \* to non-infringement of third party rights, merchantability, or \* \* fitness for any particular purpose. In no event will SOFA be \* \* liable to the user for any consequential, incidental, or special \* \* damages, including any lost profits or lost savings, even if a \* \* SOFA representative has been advised of such damages, or for any \* \* claim by any third party. \* \* \* \* 6. The provision of any version of the SOFA software under the terms \* \* and conditions specified herein does not imply that future \* \* versions will also be made available under the same terms and \* \* conditions.

```

void iauHfk5z(double rh, double dh, double date1, double date2, double \*r5, double \*d5, double \*dr5, double \*dd5) /\* , \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* iauHfk5z \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* \* \* Transform a Hipparcos star position into FK5 J2000.0, assuming \* \* zero Hipparcos proper motion. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* double Hipparcos RA (radians) rh \* \* dh Hipparcos Dec (radians) double \* \* date1,date2 double TDB date (Note 1) \* \* \* \* Returned (all FK5, equinox J2000.0, date date1+date2): \* \* RA (radians) r5 double \* \* d5 double Dec (radians) \* \* FK5 RA proper motion (rad/year, Note 4) dr5 double \* \* double dd5 Dec proper motion (rad/year, Note 4) \* \* \* \* Notes: \* \* \* \* 1) The TT date date1+date2 is a Julian Date, apportioned in any convenient way between the two arguments. For example, \* \* \* \* JD(TT)=2450123.7 could be expressed in any of these ways, \* \* among others: \* \* \* \* date1 date2 \* \* \* \* 2450123.7 0.0 (JD method) -1421.3 \* \* 2451545.0 (J2000 method) \* \* 50123.2 2400000.5 (MJD method) \* \* 2450123.5 (date & time method) 0.2 \* \* \* \* The JD method is the most natural and convenient to use in \* \* cases where the loss of several decimal digits of resolution \* \* is acceptable. The J2000 method is best matched to the way the argument is handled internally and will deliver the \* \* \* \* optimum resolution. The MJD method and the date & time methods \* \* are both good compromises between resolution and convenience. \* \* \* \* 2) The proper motion in RA is dRA/dt rather than cos(Dec)\*dRA/dt. \* \* \* \* 3) The FK5 to Hipparcos transformation is modeled as a pure rotation \* \* and spin; zonal errors in the FK5 catalogue are not taken into \* \* account. \* \* \* \* 4) It was the intention that Hipparcos should be a close \* \* approximation to an inertial frame, so that distant objects have \* \* zero proper motion; such objects have (in general) non-zero \* \* proper motion in FK5, and this function returns those fictitious \* \* proper motions. \* \* \* \* 5) The position returned by this function is in the FK5 J2000.0 \* \* reference system but at date date1+date2. \* \* \* \* 6) See also iauFk52h, iauH2fk5, iauFk5zhz. \* \* \* \* Called: \* \* spherical coordinates to unit vector iauS2c \* \* iauFk5hip FK5 to Hipparcos rotation and spin \* \* iauRxp product of r-matrix and p-vector \* \* multiply p-vector by scalar iauSxp \* \* product of two r-matrices iauRxr \* \* product of transpose of r-matrix and p-vector iauTrxp

    Transformation from ICRS to Galactic Coordinates.
* *
    This function is part of the International Astronomical Union's
* *
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
    Status: support function.
* *
* *
    Given:
* *
       dr
               double
                             ICRS right ascension (radians)
* *
       dd
               double
                            ICRS declination (radians)
* *
* *
    Returned:
* *
               double
                             galactic longitude (radians)
       d1
* *
       db
               double
                             galactic latitude (radians)
* *
* *
    Notes:
* *
* *
    1) The IAU 1958 system of Galactic coordinates was defined with
* *
       respect to the now obsolete reference system FK4 B1950.0. When
* *
       interpreting the system in a modern context, several factors have
* *
       to be taken into account:
* *
* *
        . The inclusion in FK4 positions of the E-terms of aberration.
* *
* *
        . The distortion of the FK4 proper motion system by differential
* *
          Galactic rotation.
* *
* *
       . The use of the B1950.0 equinox rather than the now-standard
* *
          J2000.0.
* *
* *
        . The frame bias between ICRS and the J2000.0 mean place system.
* *
* *
       The Hipparcos Catalogue (Perryman & ESA 1997) provides a rotation
* *
       matrix that transforms directly between ICRS and Galactic
* *
       coordinates with the above factors taken into account. The
* *
       matrix is derived from three angles, namely the ICRS coordinates
       of the Galactic pole and the longitude of the ascending node of
the galactic equator on the ICRS equator. They are given in
* *
* *
* *
       degrees to five decimal places and for canonical purposes are
       regarded as exact. In the Hipparcos Catalogue the matrix elements are given to 10 decimal places (about 20 microarcsec).
* *
* *
* *
       In the present SOFA function the matrix elements have been
* *
       recomputed from the canonical three angles and are given to 30
* *
       decimal places.
* *
* *
    2) The inverse transformation is performed by the function iauG2icrs.
* *
* *
    Called:

```

void iauLd(double bm, double p[3], double q[3], double e[3], double em, double dlim, double p1[3]) , \* \* \_ \_ \_ \_ \_ \_ \* \* iauLd \* \* \_ \_ \_ \_ \_ \_ \* \* \* \* Apply light deflection by a solar-system body, as part of \* \* transforming coordinate direction into natural direction. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* double mass of the gravitating body (solar masses) bm \* \* double[3] direction from observer to source (unit vector) р \* \* direction from body to source (unit vector) double[3] q \* \* е double[3] direction from body to observer (unit vector) \* \* em double distance from body to observer (au) \* \* dlim double deflection limiter (Note 4) \* \* \* \* Returned: \* \* double[3] observer to deflected source (unit vector) p1 \* \* \* \* Notes: \* \* \* \* 1) The algorithm is based on Expr. (70) in Klioner (2003) and \* \* Expr. (7.63) in the Explanatory Supplement (Urban & Seidelmann \* \* 2013), with some rearrangement to minimize the effects of machine \* \* precision. \* \* \* \* 2) The mass parameter bm can, as required, be adjusted in order to \* \* allow for such effects as quadrupole field. \* \* \* \* 3) The barycentric position of the deflecting body should ideally \* \* correspond to the time of closest approach of the light ray to \* \* the body. \* \* \* \* 4) The deflection limiter parameter dlim is  $phi^2/2$ , where phi is \* \* the angular separation (in radians) between source and body at \* \* which limiting is applied. As phi shrinks below the chosen \* \* threshold, the deflection is artificially reduced, reaching zero \* \* for phi = 0. \* \* \* \* 5) The returned vector p1 is not normalized, but the consequential \* \* departure from unit magnitude is always negligible. \* \* \* \* 6) The arguments p and p1 can be the same array. \* \* \* \* 7) To accumulate total light deflection taking into account the contributions from several bodies, call the present function for \* \* \* \* each body in succession, in decreasing order of distance from the \* \* observer. \* \* \* \* 8) For efficiency, validation is omitted. The supplied vectors must \* \* be of unit magnitude, and the deflection limiter non-zero and \* \* positive. \* \* \* \* References: \* \* \* \* Urban, S. & Seidelmann, P. K. void iauLdn(int n, iauLDBODY b[], double ob[3], double sc[3], double sn[3]) /\*+ \*\* \_ \_ \_ \_ \_ \_ \_ \* \* iauLdn \* \* \_ \_ \_ \_ \_ \_ \_ \* \* \* \* For a star, apply light deflection by multiple solar-system bodies, \* \* as part of transforming coordinate direction into natural direction. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* number of bodies (note 1) n int \* \* iauLDBODY[n] data for each of the n bodies (Notes 1,2): b \* \* bm mass of the body (solar masses, Note 3) double \* \* dl double deflection limiter (Note 4) barycentric PV of the body (au, au/day) \* \* [2][3] pv \* \* ob double[3] barycentric position of the observer (au) \* \* double[3] observer to star coord direction (unit vector) SC \* \* \* \* Returned: \* \* sn double[3] observer to deflected star (unit vector) \* \* \* \* 1) The array b contains n entries, one for each body to be \* \* considered. If n = 0, no gravitational light deflection will be \* \* applied, not even for the Sun. \* \* \* \* 2) The array b should include an entry for the Sun as well as for \* \* any planet or other body to be taken into account. The entries \* \* should be in the order in which the light passes the body. \* \* \* \* 3) In the entry in the b array for body i, the mass parameter \* \* b[i].bm can, as required, be adjusted in order to allow for such \* \* effects as quadrupole field. \* \* \* \* 4) The deflection limiter parameter b[i].dl is phi^2/2, where phi is \* \* the angular separation (in radians) between star and body at \* \* which limiting is applied. As phi shrinks below the chosen \* \* threshold, the deflection is artificially reduced, reaching zero \* \* for phi = 0. Example values suitable for a terrestrial \* \* observer, together with masses, are as follows: \* \* \* \* body i b[i].bm b[i].dl \* \* \* \* Sun 1.0 6e-6 \* \* 0.00095435 3e-9 Jupiter \* \* Saturn 0.00028574 3e-10 \* \* \* \* 5) For cases where the starlight passes the body before reaching the \* \* observer, the body is placed back along its barycentric track by \* \* the light time from that point to the observer. For cases where \* \* the body is "behind" the observer no such shift is applied. If \* \* a different treatment is preferred, the user has the option of instead using the iauLd function. Similarly, iauLd can be used \* \* \* \* for cases where the source is nearby, not a star. \* \* \* \* 6) The returned vector sn is not normalized, but the consequential \* \* departure from unit magnitude is always negligible. \* \* \* \* 7) The arguments sc and sn can be the same array. \* \* \* \* 8) For efficiency, validation is omitted. The supplied masses must \* \* be greater than zero, the position and velocity vectors must be \* \* right, and the deflection limiter greater than zero. \* \* \* \* Reference: \* \*

   Deflection of starlight by the Sun.
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
    Status: support function.
* *
* *
    Given:
* *
              double[3] direction from observer to star (unit vector)
      р
* *
              double[3] direction from Sun to observer (unit vector)
       е
* *
       em
              double
                          distance from Sun to observer (au)
* *
* *
   Returned:
* *
      p1
              double[3] observer to deflected star (unit vector)
* *
* *
    Notes:
* *
* *
    1) The source is presumed to be sufficiently distant that its
* *
       directions seen from the Sun and the observer are essentially
* *
       the same.
* *
* *
    2) The deflection is restrained when the angle between the star and
* *
       the center of the Sun is less than a threshold value, falling to
* *
       zero deflection for zero separation. The chosen threshold value
* *
       is within the solar limb for all solar-system applications, and
* *
       is about 5 arcminutes for the case of a terrestrial observer.
* *
* *
    3) The arguments p and p1 can be the same array.

void iauNut00a(double date1, double date2, double \*dpsi, double \*deps) 11 \* \* \* \* iauNut00a \* \* \* \* \* \* Nutation, IAU 2000A model (MHB2000 luni-solar and planetary nutation \* \* with free core nutation omitted). \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: canonical model. \* \* \* \* Given: \* \* date1,date2 double TT as a 2-part Julian Date (Note 1) \* \* \* \* Returned: \* \* double nutation, luni-solar + planetary (Note 2) dpsi,deps \* \* \* \* Notes: \* \* \* \* 1) The TT date date1+date2 is a Julian Date, apportioned in any \* \* convenient way between the two arguments. For example, \* \* JD(TT)=2450123.7 could be expressed in any of these ways, \* \* among others: \* \* \* \* date1 date2 \* \* \* \* 2450123.7 0.0 (JD method) -1421.3 \* \* (J2000 method) 2451545.0 \* \* 2400000.5 50123.2 (MJD method) \* \* 2450123.5 0.2 (date & time method) \* \* \* \* The JD method is the most natural and convenient to use in \* \* cases where the loss of several decimal digits of resolution \* \* is acceptable. The J2000 method is best matched to the way \* \* the argument is handled internally and will deliver the \* \* optimum resolution. The MJD method and the date & time methods \* \* are both good compromises between resolution and convenience. \* \* \* \* 2) The nutation components in longitude and obliquity are in radians \* \* and with respect to the equinox and ecliptic of date. The \* \* obliquity at J2000.0 is assumed to be the Lieske et al. (1977) \* \* value of 84381.448 arcsec. \* \* \* \* Both the luni-solar and planetary nutations are included. The \* \* latter are due to direct planetary nutations and the \* \* perturbations of the lunar and terrestrial orbits. \* \* \* \* 3) The function computes the MHB2000 nutation series with the \* \* associated corrections for planetary nutations. It is an \* \* implementation of the nutation part of the IAU 2000A precession-\* \* nutation model, formally adopted by the IAU General Assembly in \* \* 2000, namely MHB2000 (Mathews et al. 2002), but with the free \* \* core nutation (FCN - see Note 4) omitted. \* \* \* \* 4) The full MHB2000 model also contains contributions to the \* \* nutations in longitude and obliquity due to the free-excitation \* \* of the free-core-nutation during the period 1979-2000. These FCN \* \* terms, which are time-dependent and unpredictable, are NOT \* \* included in the present function and, if required, must be \* \* independently computed. With the FCN corrections included, the \* \* present function delivers a pole which is at current epochs \* \* accurate to a few hundred microarcseconds. The omission of FCN \* \* introduces further errors of about that size. \* \* \* \* 5) The present function provides classical nutation. The MHB2000 \* \* algorithm, from which it is adapted, deals also with (i) the \* \* offsets between the GCRS and mean poles and (ii) the adjustments \* \* in longitude and obliquity due to the changed precession rates.

These additional functions, namely frame bias and precession adjustments, are supported by the SOFA functions iauBi00  $\,$  and  $\,$ \* \* \* \* \* \* iauPr00. \* \* \* \* 6) The MHB2000 algorithm also provides "total" nutations, comprising \* \* the arithmetic sum of the frame bias, precession adjustments, \* \* luni-solar nutation and planetary nutation. These total \* \* nutations can be used in combination with an existing IAU 1976 \* \* precession implementation, such as iauPmat76, to deliver GCRS-\* \* to-true predictions of sub-mas accuracy at current dates. \* \* However, there are three shortcomings in the  $\ensuremath{\mathtt{MHB2000}}$  model that \* \* must be taken into account if more accurate or definitive results \* \* are required (see Wallace 2002): \* \* \* \* (i) The MHB2000 total nutations are simply arithmetic sums, \* \* yet in reality the various components are successive Euler rotations. This slight lack of rigor leads to cross terms \* \* \* \* that exceed 1 mas after a century. The rigorous procedure \* \* is to form the GCRS-to-true rotation matrix by applying the \* \* bias, precession and nutation in that order. \* \* \* \* (ii) Although the precession adjustments are stated to be with \* \* respect to Lieske et al. (1977), the MHB2000 model does \* \* not specify which set of Euler angles are to be used and \* \* how the adjustments are to be applied. The most literal \* \* and straightforward procedure is to adopt the 4-rotation \* \* epsilon\_0, psi\_A, omega\_A, xi\_A option, and to add DPSIPR \* \* to psi\_A and DEPSPR to both omega\_A and eps\_A. \* \* \* \* (iii) The MHB2000 model predates the determination by Chapront \* \* et al. (2002) of a 14.6 mas displacement between the \* \* J2000.0 mean equinox and the origin of the ICRS frame. \* \* should, however, be noted that neglecting this displacement \* \* when calculating star coordinates does not lead to a 14.6 mas change in right ascension, only a small second-order distortion in the pattern of the precession-nutation \* \* \* \* \* \* effect. \* \* \* \* For these reasons, the SOFA functions do not generate the "total nutations" directly, though they can of course easily be \* \* \* \* generated by calling iauBi00, iauPr00 and the present function \* \* and adding the results. \* \* \* \* 7) The MHB2000 model contains 41 instances where the same frequency \* \* appears multiple times, of which 38 are duplicates and three are \* \* triplicates. To keep the present code close to the original MHB \* \* algorithm, this small inefficiency has not been corrected. \* \* \* \* Called: \* \* iauFal03 mean anomaly of the Moon \* \* iauFaf03 mean argument of the latitude of the Moon \* \* mean longitude of the Moon's ascending node iauFaom03 \* \* iauFame03 mean longitude of Mercury \* \* iauFave03 mean longitude of Venus \* \* mean longitude of Earth iauFae03 \* \* iauFama03 mean longitude of Mars \* \* iauFaju03 mean longitude of Jupiter \* \* mean longitude of Saturn iauFasa03 \* \* iauFaur03 mean longitude of Uranus \* \* iauFapa03 general accumulated precession in longitude \* \* \* \* References: \* \* \* \* Chapront, J., Chapront-Touze, M. & Francou, G. 2002, \* \* Astron.Astrophys. 387, 700 \* \* \* \* Lieske, J.H., Lederle, T., Fricke, W. & Morando, B. 1977, \* \* Astron.Astrophys. 58, 1-16 \* \* \* \* Mathews, P.M., Herring, T.A., Buffet, B.A. 2002, J.Geophys.Res. \* \* 107, B4. void iauNut00b(double date1, double date2, double \*dpsi, double \*deps) \* \* \* \* iauNut00b \* \* \* \* \* \* Nutation, IAU 2000B model. \* \* This function is part of the International Astronomical Union's \* \* \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: canonical model. \* \* \* \* Given: \* \* date1,date2 double TT as a 2-part Julian Date (Note 1) \* \* \* \* Returned: \* \* dpsi,deps double nutation, luni-solar + planetary (Note 2) \* \* \* \* Notes: \* \* \* \* 1) The TT date date1+date2 is a Julian Date, apportioned in any \* \* convenient way between the two arguments. For example, \* \* JD(TT)=2450123.7 could be expressed in any of these ways, \* \* among others: \* \* \* \* date1 date2 \* \* \* \* 2450123.7 0.0 (JD method) \* \* 2451545.0 -1421.3 (J2000 method) \* \* 2400000.5 50123.2 (MJD method) \* \* 2450123.5 0.2 (date & time method) \* \* \* \* The JD method is the most natural and convenient to use in \* \* cases where the loss of several decimal digits of resolution \* \* is acceptable. The J2000 method is best matched to the way \* \* the argument is handled internally and will deliver the \* \* optimum resolution. The MJD method and the date & time methods \* \* are both good compromises between resolution and convenience. \* \* \* \* 2) The nutation components in longitude and obliquity are in radians \* \* and with respect to the equinox and ecliptic of date. The \* \* obliquity at J2000.0 is assumed to be the Lieske et al. (1977) \* \* value of 84381.448 arcsec. (The errors that result from using \* \* this function with the IAU 2006 value of 84381.406 arcsec can be \* \* neglected.) \* \* \* \* The nutation model consists only of luni-solar terms, but includes also a fixed offset which compensates for certain long-period planetary terms (Note 7). \* \* \* \* \* \* \* \* 3) This function is an implementation of the IAU 2000B abridged \* \* nutation model formally adopted by the IAU General Assembly in \* \* 2000. The function computes the MHB\_2000\_SHORT luni-solar \* \* nutation series (Luzum 2001), but without the associated \* \* corrections for the precession rate adjustments and the offset \* \* between the GCRS and J2000.0 mean poles. \* \* \* \* 4) The full IAU 2000A (MHB2000) nutation model contains nearly 1400 \* \* terms. The IAU 2000B model (McCarthy & Luzum 2003) contains only \* \* 77 terms, plus additional simplifications, yet still delivers \* \* results of 1 mas accuracy at present epochs. This combination of \* \* accuracy and size makes the IAU 2000B abridged nutation model \* \* suitable for most practical applications. \* \* \* \* The function delivers a pole accurate to 1 mas from 1900 to 2100 \* \* (usually better than 1 mas, very occasionally just outside 1 mas). The full IAU 2000A model, which is implemented in the \* \* \* \* function iauNut00a (q.v.), delivers considerably greater accuracy at current dates; however, to realize this improved accuracy, \* \* \* \* corrections for the essentially unpredictable free-core-nutation

\* \* (FCN) must also be included. \* \* \* \* 5) The present function provides classical nutation. The \* \* MHB\_2000\_SHORT algorithm, from which it is adapted, deals also \* \* with (i) the offsets between the GCRS and mean poles and (ii) the \* \* adjustments in longitude and obliquity due to the changed precession rates. These additional functions, namely frame bias and precession adjustments, are supported by the SOFA functions \* \* \* \* \* \* iauBi00 and iauPr00. \* \* \* \* 6) The MHB\_2000\_SHORT algorithm also provides "total" nutations, \* \* comprising the arithmetic sum of the frame bias, precession \* \* adjustments, and nutation (luni-solar + planetary). These total \* \* nutations can be used in combination with an existing IAU 1976 \* \* precession implementation, such as iauPmat76, to deliver GCRS-\* \* to-true predictions of mas accuracy at current epochs. However, for symmetry with the iauNut00a function (q.v. for the reasons), \* \* \* \* the SOFA functions do not generate the "total nutations" \* \* directly. Should they be required, they could of course easily \* \* be generated by calling iauBi00, iauPr00 and the present function \* \* and adding the results. \* \* \* \* 7) The IAU 2000B model includes "planetary bias" terms that are \* \* fixed in size but compensate for long-period nutations. The \* \* amplitudes quoted in McCarthy & Luzum (2003), namely \* \* Dpsi = -1.5835 mas and Depsilon = +1.6339 mas, are optimized for \* \* the "total nutations" method described in Note 6. The Luzum \* \* (2001) values used in this SOFA implementation, namely -0.135 mas \* \* and +0.388 mas, are optimized for the "rigorous" method, where frame bias, precession and nutation are applied separately and in \* \* \* \* that order. During the interval 1995-2050, the SOFA \* \* implementation delivers a maximum error of 1.001 mas (not \* \* including FCN). \* \* \* \* References: \* \* \* \* Lieske, J.H., Lederle, T., Fricke, W., Morando, B., "Expressions \* \* for the precession quantities based upon the IAU /1976/ system of \* \* astronomical constants", Astron.Astrophys. 58, 1-2, 1-16. The MJD method and the date & time methods \* \* are both good compromises between resolution and convenience. \* \* \* \* 2) This function returns the set of equinox based angles for the \* \* Capitaine et al. "P03" precession theory, adopted by the IAU in \* \* The angles are set out in Table 1 of Hilton et al. (2006): 2006. \* \* \* \* epsilon\_0 obliquity at J2000.0 eps0 \* \* psia psi\_A luni-solar precession \* \* inclination of equator wrt J2000.0 ecliptic oma omega\_A ecliptic pole x, J2000.0 ecliptic triad \* \* bpa ΡΑ \* \* ecliptic pole -y, J2000.0 ecliptic triad bqa Q\_A \* \* angle between moving and J2000.0 ecliptics pia pi\_A \* \* bpia Pi A longitude of ascending node of the ecliptic

\* \* epsilon A obliquity of the ecliptic epsa \* \* planetary precession chia chi A \* \* za z\_A equatorial precession: -3rd 323 Euler angle equatorial precession: -1st 323 Euler angle equatorial precession: 2nd 323 Euler angle \* \* zetaa zeta\_A \* \* thetaa theta\_A \* \* general precession pa рΑ \* \* gamma J2000 J2000.0 RA difference of ecliptic poles gam \* \* phi\_J2000 J2000.0 codeclination of ecliptic pole phi \* \* longitude difference of equator poles, J2000.0 psi\_J2000 psi \* \* \* \* The returned values are all radians. \* \* \* \* 3) Hilton et al. (2006) Table 1 also contains angles that depend on \* \* models distinct from the PO3 precession theory itself, namely the \* \* IAU 2000A frame bias and nutation. The quoted polynomials are \* \* used in other SOFA functions: \* \* \* \* . iauXy06 contains the polynomial parts of the X and Y series. \* \* \* \* . iauS06 contains the polynomial part of the s+XY/2 series. \* \* \* \* . iauPfw06 implements the series for the Fukushima-Williams \* \* angles that are with respect to the GCRS pole (i.e. the variants \* \* that include frame bias). \* \* \* \* 4) The IAU resolution stipulated that the choice of parameterization \* \* was left to the user, and so an IAU compliant precession \* \* implementation can be constructed using various combinations of \* \* the angles returned by the present function. \* \* \* \* 5) The parameterization used by SOFA is the version of the Fukushima-\* \* Williams angles that refers directly to the GCRS pole. These \* \* angles may be calculated by calling the function iauPfw06. SOFA \* \* also supports the direct computation of the CIP GCRS  ${\tt X}, {\tt Y}$  by \* \* series, available by calling iauXy06. \* \* \* \* 6) The agreement between the different parameterizations is at the \* \* 1 microarcsecond level in the present era. \* \* \* \* 7) When constructing a precession formulation that refers to the GCRS pole rather than the dynamical pole, it may (depending on the choice of angles) be necessary to introduce the frame bias \* \* \* \* \* \* explicitly. \* \* \* \* 8) It is permissible to re-use the same variable in the returned \* \* arguments. The quantities are stored in the stated order. \* \* \* \* Reference: \* \* \* \* Hilton, J. et al., 2006, Celest.Mech.Dyn.Astron. 94, 351 \* \* \* \* Called: \* \* iauObl06 mean obliquity, IAU 2006 \* \* \*/

        - - - -
* *
* *
    Position-angle from two p-vectors.
* *
    This function is part of the International Astronomical Union's SOFA (Standards Of Fundamental Astronomy) software collection.
* *
* *
* *
* *
    Status: vector/matrix support function.
* *
* *
     Given:
* *
                 double[3] direction of reference point
        а
* *
        h
                 double[3] direction of point whose PA is required
* *
* *
    Returned (function value):
* *
                              position angle of b with respect to a (radians)
                 double
* *
* *
    Notes:
* *
* *
    1) The result is the position angle, in radians, of direction b with respect to direction a. It is in the range -pi to +pi. The
* *
* *
         sense is such that if b is a small distance "north" of a the
        position angle is approximately zero, and if b is a small distance "east" of a the position angle is approximately +pi/2.
* *
* *
* *
* *
     2) The vectors a and b need not be of unit length.
* *
* *
     3) Zero is returned if the two directions are the same or if either
* *
        vector is null.
* *
* *
    4) If vector a is at a pole, the result is ill-defined.
* *
* *
     Called:
                         decompose p-vector into modulus and direction modulus of p-vector

double iauPas(double al, double ap, double bl, double bp) /\* . \* \* \_ \_ \_ \_ \_ \_ \* \* iauPas \* \* - - - - -\* \* \* \* Position-angle from spherical coordinates. \* \* This function is part of the International Astronomical Union's SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* \* \* \* \* Status: vector/matrix support function. \* \* \* \* Given: \* \* longitude of point A (e.g. RA) in radians latitude of point A (e.g. Dec) in radians longitude of point B  $\,$ al double \* \* double ap \* \* bl double \* \* bp double latitude of point B \* \* \* \* Returned (function value): \* \* double position angle of B with respect to A \* \* \* \* Notes: \* \* \* \* 1) The result is the bearing (position angle), in radians, of point \* \* B with respect to point A. It is in the range -pi to +pi. The sense is such that if B is a small distance "east" of point A, \* \* \* \* the bearing is approximately +pi/2. \* \* \* \* 2) Zero is returned if the two points are coincident. \* \* \* /

void iauPb06(double date1, double date2, double \*bzeta, double \*bz, double \*btheta) , \* \* \_ \_ \_ \_ \_ \_ \_ iauPb06 \* \* \* \* \_ \_ \_ \_ \_ \_ \_ \_ \* \* \* \* This function forms three Euler angles which implement general \* \* precession from epoch J2000.0, using the IAU 2006 model. Frame \* \* bias (the offset between ICRS and mean J2000.0) is included. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* date1, date2 double TT as a 2-part Julian Date (Note 1) \* \* \* \* Returned: \* \* bzeta double 1st rotation: radians cw around z \* \* bz double 3rd rotation: radians cw around  ${\tt z}$ \* \* btheta double 2nd rotation: radians ccw around y \* \* \* \* Notes: \* \* \* \* 1) The TT date date1+date2 is a Julian Date, apportioned in any \* \* convenient way between the two arguments. For example, \* \* JD(TT)=2450123.7 could be expressed in any of these ways, \* \* among others: \* \* \* \* date1 date2 \* \* \* \* 2450123.7 0.0 (JD method) \* \* -1421.3 2451545.0 (J2000 method) \* \* 50123.2 2400000.5 (MJD method) \* \* 2450123.5 (date & time method) 0.2 \* \* \* \* The JD method is the most natural and convenient to use in cases where the loss of several decimal digits of resolution is acceptable. The J2000 method is best matched to the way \* \* \* \* \* \* the argument is handled internally and will deliver the \* \* optimum resolution. The MJD method and the date & time methods \* \* are both good compromises between resolution and convenience. \* \* \* \* 2) The traditional accumulated precession angles zeta\_A, z\_A, \* \* theta\_A cannot be obtained in the usual way, namely through \* \* polynomial expressions, because of the frame bias. The latter \* \* means that two of the angles undergo rapid changes near this \* \* date. They are instead the results of decomposing the \* \* precession-bias matrix obtained by using the Fukushima-Williams method, which does not suffer from the problem. The \* \* \* \* decomposition returns values which can be used in the \* \* conventional formulation and which include frame bias. \* \* \* \* 3) The three angles are returned in the conventional order, which \* \* is not the same as the order of the corresponding Euler \* \* rotations. The precession-bias matrix is \* \*  $R_3(-z) \propto R_2(+theta) \propto R_3(-zeta)$ . \* \* 4) Should zeta\_A, z\_A, theta\_A angles be required that do not \* \* \* \* contain frame bias, they are available by calling the SOFA \* \* function iauP06e. \* \* \* \* Called: \* \* iauPmat06 PB matrix, IAU 2006 \* \* rotate around Z-axis iauRz \* \* \* /

    Notes:
* *
* *
    1) The TT date date1+date2 is a Julian Date, apportioned in any
* *
       convenient way between the two arguments. For example,
* *
       JD(TT)=2450123.7 could be expressed in any of these ways,
* *
       among others:
* *
* *
                               date2
               date1
* *
* *
            2450123.7
                                  0.0
                                             (JD method)
* *
                             -1421.3
            2451545.0
                                             (J2000 method)
* *
            2400000.5
                             50123.2
                                             (MJD method)
* *
            2450123.5
                                  0.2
                                             (date & time method)
* *
* *
       The JD method is the most natural and convenient to use in
* *
       cases where the loss of several decimal digits of resolution
       is acceptable. The J2000 method is best matched to the way the argument is handled internally and will deliver the
* *
* *
* *
       optimum resolution. The MJD method and the date & time methods
* *
       are both good compromises between resolution and convenience.
* *
* *
    2) Naming the following points:
* *
* *
              e = J2000.0 ecliptic pole,
* *
              p = GCRS pole,
* *
              E = mean ecliptic pole of date,
* *
              P = mean pole of date,
       and
* *
* *
       the four Fukushima-Williams angles are as follows:
* *
* *
           gamb = gamma_bar = epE
* *
           phib = phi_bar = pE
* *
          psib = psi_bar = pEP
* *
           epsa = epsilon_A = EP
* *
* *
    3) The matrix representing the combined effects of frame bias and
* *
       precession is:
* *
* *
           PxB = R_1(-epsa).R_3(-psib).R_1(phib).R_3(gamb)
* *
* *
    4) The matrix representing the combined effects of frame bias,
* *
       precession and nutation is simply:
* *
* *
          NxPxB = R_1(-epsa-dE).R_3(-psib-dP).R_1(phib).R_3(gamb)
* *
* *
       where dP and dE are the nutation components with respect to the
* *
       ecliptic of date.
* *

* *
* *
* *
    Notes:
* *
* *
    1) The date date1+date2 is in the TDB time scale (in practice TT can
* *
       be used) and is a Julian Date, apportioned in any convenient way
* *
       between the two arguments. For example, JD(TDB)=2450123.7 could
* *
       be expressed in any of these ways, among others:
* *
* *
               date1
                               date2
* *
* *
            2450123.7
                                 0.0
                                            (JD method)
* *
                             -1421.3
            2451545.0
                                            (J2000 method)
* *
            2400000.5
                             50123.2
                                            (MJD method)
* *
            2450123.5
                                 0.2
                                            (date & time method)
* *
* *
       The JD method is the most natural and convenient to use in cases
* *
       where the loss of several decimal digits of resolution is
* *
       acceptable. The J2000 method is best matched to the way the
* *
       argument is handled internally and will deliver the optimum
* *
       resolution. The MJD method and the date & time methods are both
* *
       good compromises between resolution and convenience. The limited
* *
       accuracy of the present algorithm is such that any of the methods
* *
       is satisfactory.
* *
* *
    2) If an np value outside the range 1-8 is supplied, an error status
* *
       (function value -1) is returned and the pv vector set to zeroes.
* *
* *
    3) For np=3 the result is for the Earth-Moon Barycenter. To obtain
* *
       the heliocentric position and velocity of the Earth, use instead
* *
       the SOFA function iauEpv00.
* *
* *
    4) On successful return, the array pv contains the following:
* *
* *
          pv[0][0]
                      х
* *
          pv[0][1]
                                heliocentric position, au
                      У
* *
          pv[0][2]
                      \mathbf{Z}
* *
* *
          pv[1][0]
                      xdot
* *
          pv[1][1]
                      ydot
                                heliocentric velocity, au/d
* *
                      zdot
          pv[1][2]
* *
* *
       The reference frame is equatorial and is with respect to the
```

\* \* mean equator and equinox of epoch J2000.0. \* \* \* \* 5) The algorithm is due to J.L. Simon, P. Bretagnon, J. Chapront, \* \* M. Chapront-Touze, G. Francou and J. Laskar (Bureau des \* \* Longitudes, Paris, France). From comparisons with JPL ephemeris DE102, they quote the following maximum errors \* \* \* \* over the interval 1800-2050: \* \* \* \* L (arcsec) B (arcsec) R (km) \* \* \* \* 4 300 Mercury 1 \* \* 5 Venus 1 800 \* \* б 1 1000 EMB \* \* Mars 17 1 7700 \* \* 71 5 76000 Jupiter \* \* Saturn 81 13 267000 \* \* 86 7 712000 Uranus \* \* 253000 Neptune 11 1 \* \* \* \* Over the interval 1000-3000, they report that the accuracy is no \* \* worse than 1.5 times that over 1800-2050. Outside 1000-3000 the \* \* accuracy declines. \* \* \* \* Comparisons of the present function with the JPL DE200 ephemeris \* \* give the following RMS errors over the interval 1960-2025: \* \* \* \* position (km) velocity (m/s) \* \* \* \* 334 0.437 Mercury \* \* 0.855 Venus 1060 \* \* EMB 2010 0.815 \* \* 1.98 7690 Mars \* \* Jupiter 71700 7.70 \* \* 19.4 Saturn 199000 \* \* 564000 16.4 Uranus \* \* Neptune 158000 14.4 \* \* \* \* Comparisons against DE200 over the interval 1800-2100 gave the \* \* following maximum absolute differences. (The results using \* \* DE406 were essentially the same.) \* \* \* \* L (arcsec) B (arcsec) R (km) Rdot (m/s) \* \* \* \* Mercury 7 1 500 0.7 \* \* Venus 7 1 1100 0.9 \* \* 9 1.0 EMB 1 1300 \* \* Mars 26 1 9000 2.5 \* \* Jupiter 78 б 82000 8.2 \* \* 87 14 263000 24.6 Saturn \* \* 7 Uranus 86 661000 27.4 \* \* Neptune 11 2 248000 21.4 \* \* \* \* 6) The present SOFA re-implementation of the original Simon et al. \* \* Fortran code differs from the original in the following respects: \* \* \* \* C instead of Fortran. \* \* \* \* \* The date is supplied in two parts. \* \* \* \* The result is returned only in equatorial Cartesian form; the ecliptic longitude, latitude and radius vector are not \* \* \* \* returned. \* \* \* \* \* The result is in the J2000.0 equatorial frame, not ecliptic. \* \* \* \* \* More is done in-line: there are fewer calls to subroutines. \* \* \* \* \* Different error/warning status values are used. \* \* \* \* \* A different Kepler's-equation-solver is used (avoiding \* \* use of double precision complex). \* \* \* \* \* Polynomials in t are nested to minimize rounding errors.

| * *<br>* *<br>* *<br>* *        | * Explicit double constants are used to avoid mixed-mode expressions.  |
|---------------------------------|--|
| **                              | None of the above changes affects the result significantly.  |
| * *<br>* *<br>* *<br>* *<br>* * | 7) The returned status indicates the most serious condition<br>encountered during execution of the function. Illegal np is<br>considered the most serious, overriding failure to converge,<br>which in turn takes precedence over the remote date warning. Called: |
| * *<br>* *                      | iauAnp normalize angle into range 0 to 2pi   |

       рсо
* *
* *
    Notes:
* *
* *
    1) The proper motion in RA is dRA/dt rather than cos(Dec)*dRA/dt.
* *
* *
    2) The proper motion time interval is for when the starlight
* *
       reaches the solar system barycenter.
* *
* *
    3) To avoid the need for iteration, the Roemer effect (i.e. the
* *
       small annual modulation of the proper motion coming from the
* *
       changing light time) is applied approximately, using the
* *
       direction of the star at the catalog epoch.

int iauPmsafe(double ra1, double dec1, double pmr1, double pmd1, double px1, double rv1, double ep1a, double ep1b, double ep2a, double ep2b, double \*ra2, double \*dec2, double \*pmr2, double \*pmd2, double \*px2, double \*rv2) , \* \* \* \* iauPmsafe \* \* \* \* \* \* Star proper motion: update star catalog data for space motion, with special handling to handle the zero parallax case. \* \* \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* ra1 double right ascension (radians), before declination (radians), before \* \* dec1 double \* \* pmr1 double RA proper motion (radians/year), before \* \* Dec proper motion (radians/year), before pmd1 double \* \* px1 double parallax (arcseconds), before \* \* radial velocity (km/s, +ve = receding), before "before" epoch, part A (Note 1) "before" epoch, part B (Note 1) rv1 double \* \* ep1a double \* \* ep1b double "after" epoch, part A (Note 1) "after" epoch, part B (Note 1) \* \* ep2a double \* \* ep2b double \* \* \* \* Returned: \* \* ra2 double right ascension (radians), after \* \* dec2 declination (radians), after double \* \* pmr2 double RA proper motion (radians/year), after \* \* pmd2 double Dec proper motion (radians/year), after parallax (arcseconds), after \* \* double px2 \* \* double radial velocity (km/s, +ve = receding), after rv2 \* \* \* \* Returned (function value): \* \* int status: \* \* -1 = system error (should not occur) \* \* 0 = no warnings or errors \* \* 1 = distance overridden (Note 6) \* \* 2 = excessive velocity (Note 7) \* \* 4 = solution didn't converge (Note 8) \* \* else = binary logical OR of the above warnings \* \* \* \* Notes: \* \* \* \* 1) The starting and ending TDB epochs epla+eplb and ep2a+ep2b are \* \* Julian Dates, apportioned in any convenient way between the two parts (A and B). For example, JD(TDB)=2450123.7 could be expressed in any of these ways, among others: \* \* \* \* \* \* \* \* epNa epNb \* \* \* \* 2450123.7 0.0 (JD method) \* \* -1421.3 (J2000 method) 2451545.0 \* \* 2400000.5 50123.2 (MJD method) \* \* 2450123.5 0.2 (date & time method) \* \* \* \* The JD method is the most natural and convenient to use in cases \* \* where the loss of several decimal digits of resolution is \* \* acceptable. The J2000 method is best matched to the way the argument is handled internally and will deliver the optimum \* \* \* \* resolution. The MJD method and the date & time methods are both \* \* good compromises between resolution and convenience. \* \* \* \* 2) In accordance with normal star-catalog conventions, the object's \* \* right ascension and declination are freed from the effects of \* \* secular aberration. The frame, which is aligned to the catalog

\* \* equator and equinox, is Lorentzian and centered on the SSB. \* \* \* \* The proper motions are the rate of change of the right ascension \* \* and declination at the catalog epoch and are in radians per TDB \* \* Julian year. \* \* \* \* The parallax and radial velocity are in the same frame. \* \* \* \* 3) Care is needed with units. The star coordinates are in radians \* \* and the proper motions in radians per Julian year, but the \* \* parallax is in arcseconds. \* \* \* \* 4) The RA proper motion is in terms of coordinate angle, not true \* \* angle. If the catalog uses arcseconds for both RA and Dec proper \* \* motions, the RA proper motion will need to be divided by cos(Dec) \* \* before use. \* \* \* \* 5) Straight-line motion at constant speed, in the inertial frame, is \* \* assumed. \* \* \* \* 6) An extremely small (or zero or negative) parallax is overridden \* \* to ensure that the object is at a finite but very large distance, but not so large that the proper motion is equivalent to a large \* \* \* \* but safe speed (about 0.1c using the chosen constant). A warning \* \* status of 1 is added to the status if this action has been taken. \* \* \* \* 7) If the space velocity is a significant fraction of c (see the constant VMAX in the function iauStarpv), it is arbitrarily set \* \* \* \* to zero. When this action occurs, 2 is added to the status. \* \* \* \* 8) The relativistic adjustment carried out in the iauStarpv function \* \* involves an iterative calculation. If the process fails to \* \* converge within a set number of iterations,  $4\ \mathrm{is}$  added to the \* \* status. \* \* \* \* Called: \* \* iauSeps angle between two points \* \* update star catalog data for space motion iauStarpm \* \* \* /

       rnpb
* *
* *
    Notes:
* *
* *
    1) The TT date date1+date2 is a Julian Date, apportioned in any
* *
       convenient way between the two arguments. For example,
* *
       JD(TT)=2450123.7 could be expressed in any of these ways,
* *
       among others:
* *
* *
               date1
                               date2
* *
* *
            2450123.7
                                             (JD method)
                                  0.0
                             -1421.3
* *
            2451545.0
                                             (J2000 method)
* *
            2400000.5
                             50123.2
                                             (MJD method)
* *
                                             (date & time method)
            2450123.5
                                  0.2
* *
* *
       The JD method is the most natural and convenient to use in
* *
       cases where the loss of several decimal digits of resolution
* *
       is acceptable. The J2000 method is best matched to the way
       the argument is handled internally and will deliver the
* *
* *
       optimum resolution. The MJD method and the date & time methods
* *
       are both good compromises between resolution and convenience.

void iauPr00(double date1, double date2, double \*dpsipr, double \*depspr) /\* \* \* \* \* iauPr00 \* \* \* \* \* \* Precession-rate part of the IAU 2000 precession-nutation models \* \* (part of MHB2000). \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: canonical model. \* \* \* \* Given: \* \* double TT as a 2-part Julian Date (Note 1) date1,date2 \* \* \* \* Returned: \* \* dpsipr,depspr double precession corrections (Notes 2,3) \* \* \* \* Notes: \* \* \* \* 1) The TT date date1+date2 is a Julian Date, apportioned in any \* \* convenient way between the two arguments. For example, \* \* JD(TT)=2450123.7 could be expressed in any of these ways, \* \* among others: \* \* \* \* date1 date2 \* \* \* \* 2450123.7 0.0 (JD method) -1421.3 \* \* (J2000 method) 2451545.0 \* \* 2400000.5 50123.2 (MJD method) \* \* 2450123.5 0.2 (date & time method) \* \* \* \* The JD method is the most natural and convenient to use in \* \* cases where the loss of several decimal digits of resolution \* \* is acceptable. The J2000 method is best matched to the way the argument is handled internally and will deliver the \* \* \* \* optimum resolution. The MJD method and the date & time methods \* \* are both good compromises between resolution and convenience. \* \* \* \* 2) The precession adjustments are expressed as "nutation \* \* components", corrections in longitude and obliquity with respect \* \* to the J2000.0 equinox and ecliptic. \* \* \* \* 3) Although the precession adjustments are stated to be with respect \* \* to Lieske et al. (1977), the MHB2000 model does not specify which \* \* set of Euler angles are to be used and how the adjustments are to be applied. The most literal and straightforward procedure is to \* \* \* \* adopt the 4-rotation epsilon\_0, psi\_A, omega\_A, xi\_A option, and \* \* to add dpsipr to psi\_A and depspr to both omega\_A and eps\_A. \* \* \* \* 4) This is an implementation of one aspect of the IAU 2000A nutation \* \* model, formally adopted by the IAU General Assembly in 2000, \* \* namely MHB2000 (Mathews et al. 2002). \* \* \* \* References: \* \* \* \* Lieske, J.H., Lederle, T., Fricke, W. & Morando, B., "Expressions \* \* for the precession quantities based upon the IAU (1976) System of \* \* Astronomical Constants", Astron.Astrophys., 58, 1-16 (1977) \* \* \* \* Mathews, P.M., Herring, T.A., Buffet, B.A., "Modeling of nutation \* \* and precession New nutation series for nonrigid Earth and \* \* insights into the Earth's interior", J.Geophys.Res., 107, B4, \* \* 2002. The MHB2000 code itself was obtained on 9th September 2002 \* \* from ftp://maia.usno.navy.mil/conv2000/chapter5/IAU2000A. \* \* Wallace, P.T., "Software for Implementing the IAU 2000 Resolutions", in IERS Workshop 5.1 (2002). \* \* \* \* \* \*

\* /

void iauPrec76(double date01, double date02, double date11, double date12, double \*zeta, double \*z, double \*theta) , \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* iauPrec76 \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* \* \* IAU 1976 precession model. \* \* \* \* This function forms the three Euler angles which implement general \* \* precession between two dates, using the IAU 1976 model (as for the \* \* FK5 catalog). \* \* This function is part of the International Astronomical Union's \* \* \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: canonical model. \* \* \* \* Given: \* \* date01,date02 double TDB starting date (Note 1) \* \* date11,date12 double TDB ending date (Note 1) \* \* \* \* Returned: \* \* zeta double 1st rotation: radians cw around z \* \* double 3rd rotation: radians cw around z Z \* \* theta double 2nd rotation: radians ccw around y \* \* \* \* Notes: \* \* \* \* 1) The dates date01+date02 and date11+date12 are Julian Dates, \* \* apportioned in any convenient way between the arguments daten1 and daten2. For example, JD(TDB)=2450123.7 could be expressed in \* \* \* \* any of these ways, among others: \* \* \* \* daten1 daten2 \* \* \* \* 2450123.7 0.0 (JD method) \* \* -1421.3 2451545.0 (J2000 method) \* \* 2400000.5 50123.2 (MJD method) \* \* 2450123.5 0.2 (date & time method) \* \* \* \* The JD method is the most natural and convenient to use in cases \* \* where the loss of several decimal digits of resolution is \* \* acceptable. The J2000 method is best matched to the way the \* \* argument is handled internally and will deliver the optimum \* \* optimum resolution. The MJD method and the date & time methods \* \* are both good compromises between resolution and convenience. \* \* The two dates may be expressed using different methods, but at \* \* the risk of losing some resolution. \* \* \* \* 2) The accumulated precession angles zeta, z, theta are expressed \* \* through canonical polynomials which are valid only for a limited \* \* time span. In addition, the IAU 1976 precession rate is known to \* \* be imperfect. The absolute accuracy of the present formulation \* \* is better than 0.1 arcsec from 1960AD to 2040AD, better than 1 arcsec from 1640AD to 2360AD, and remains below 3 arcsec for \* \* \* \* the whole of the period 500BC to 3000AD. The errors exceed \* \* 10 arcsec outside the range 1200BC to 3900AD, exceed 100 arcsec \* \* outside 4200BC to 5600AD and exceed 1000 arcsec outside 6800BC to \* \* 8200AD. \* \* \* \* 3) The three angles are returned in the conventional order, which \* \* is not the same as the order of the corresponding Euler \* \* rotations. The precession matrix is \* \*  $R_3(-z) \propto R_2(+theta) \propto R_3(-zeta)$ . \* \* \* \* Reference: \* \* \* \* Lieske, J.H., 1979, Astron.Astrophys. 73, 282, equations \* \* (6) & (7), p283. \* \*

       rd
                 double
                                 rate of change of r
* *
* *
    Notes:
* *
* *
    1) If the position part of pv is null, theta, phi, td and pd
* *
       are indeterminate. This is handled by extrapolating the
* *
       position through unit time by using the velocity part of
* *
       pv. This moves the origin without changing the direction
* *
       of the velocity component. If the position and velocity
       components of pv are both null, zeroes are returned for all
* *
* *
        six results.
* *
    2) If the position is a pole, theta, td and pd are indeterminate.
In such cases zeroes are returned for all three.

int iauPvstar(double pv[2][3], double \*ra, double \*dec, double \*pmr, double \*pmd, double \*px, double \*rv) , \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* iauPvstar \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* \* \* Convert star position+velocity vector to catalog coordinates. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given (Note 1): \* \* double[2][3] pv-vector (au, au/day) pv \* \* \* \* Returned (Note 2): \* \* double right ascension (radians) ra \* \* dec double declination (radians) \* \* double RA proper motion (radians/year) pmr \* \* pmd double Dec proper motion (radians/year) \* \* double parallax (arcsec) рх \* \* rv double radial velocity (km/s, positive = receding) \* \* \* \* Returned (function value): \* \* int status: \* \* 0 = OK\* \* -1 = superluminal speed (Note 5) \* \* -2 = null position vector \* \* \* \* Notes: \* \* \* \* 1) The specified pv-vector is the coordinate direction (and its rate \* \* of change) for the date at which the light leaving the star \* \* reached the solar-system barycenter. \* \* \* \* 2) The star data returned by this function are "observables" for an \* \* imaginary observer at the solar-system barycenter. Proper motion \* \* and radial velocity are, strictly, in terms of barycentric \* \* coordinate time, TCB. For most practical applications, it is \* \* permissible to neglect the distinction between TCB and ordinary "proper" time on Earth (TT/TAI). The result will, as a rule, be limited by the intrinsic accuracy of the proper-motion and radial-velocity data; moreover, the supplied pv-vector is likely \* \* \* \* \* \* to be merely an intermediate result (for example generated by the function iauStarpv), so that a change of time unit will cancel \* \* \* \* \* \* out overall. \* \* \* \* In accordance with normal star-catalog conventions, the object's \* \* right ascension and declination are freed from the effects of secular aberration. The frame, which is aligned to the catalog equator and equinox, is Lorentzian and centered on the SSB. \* \* \* \* \* \* \* \* Summarizing, the specified pv-vector is for most stars almost identical to the result of applying the standard geometrical \* \* \* \* "space motion" transformation to the catalog data. The \* \* differences, which are the subject of the Stumpff paper cited \* \* below, are: \* \* \* \* (i) In stars with significant radial velocity and proper motion, \* \* the constantly changing light-time distorts the apparent proper \* \* motion. Note that this is a classical, not a relativistic, \* \* effect. \* \* \* \* (ii) The transformation complies with special relativity. \* \* \* \* 3) Care is needed with units. The star coordinates are in radians \* \* and the proper motions in radians per Julian year, but the \* \* parallax is in arcseconds; the radial velocity is in km/s, but \* \* the pv-vector result is in au and au/day.

| * *<br>* *<br>* *<br>* *<br>* *                   | The proper motions are the rate of change of the right ascension<br>and declination at the catalog epoch and are in radians per Julian<br>year. The RA proper motion is in terms of coordinate angle, not<br>true angle, and will thus be numerically larger at high<br>declinations.  |  |  |  |
|---|--|--|--|--|
| * *<br>* *<br>* *                                 | Straight-line motion at constant speed in the inertial frame is assumed. If the speed is greater than or equal to the speed of light, the function aborts with an error status.  |  |  |  |
| * *   | 6) The inverse transformation is performed by the function iauStarpv.  |  |  |  |

void iauRefco(double phpa, double tc, double rh, double wl, double \*refa, double \*refb) /\* , \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* iauRefco \* \* \_ \_ \_ \_ \_ \_ \_ \_ \_ \* \* \* \* Determine the constants A and B in the atmospheric refraction model \* \*  $dZ = A \tan Z + B \tan^3 Z$ . \* \* \* \* Z is the "observed" zenith distance (i.e. affected by refraction) \* \* and dZ is what to add to Z to give the "topocentric" (i.e. in vacuo) \* \* zenith distance. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards of Fundamental Astronomy) software collection. \* \* \* \* Status: support function. \* \* \* \* Given: \* \* phpa double pressure at the observer (hPa = millibar) \* \* ambient temperature at the observer (deg C) tc double \* \* rh double relative humidity at the observer (range 0-1) \* \* wl double wavelength (micrometers) \* \* \* \* Returned: \* \* double\* tan Z coefficient (radians) refa \* \* refb double\* tan^3 Z coefficient (radians) \* \* \* \* Notes: \* \* \* \* 1) The model balances speed and accuracy to give good results in \* \* applications where performance at low altitudes is not paramount. \* \* Performance is maintained across a range of conditions, and \* \* applies to both optical/IR and radio. \* \* \* \* 2) The model omits the effects of (i) height above sea level (apart \* \* from the reduced pressure itself), (ii) latitude (i.e. the \* \* flattening of the Earth), (iii) variations in tropospheric lapse \* \* rate and (iv) dispersive effects in the radio. \* \* \* \* The model was tested using the following range of conditions: \* \* \* \* lapse rates 0.0055, 0.0065, 0.0075 deg/meter \* \* latitudes 0, 25, 50, 75 degrees heights 0, 2500, 5000 meters ASL \* \* \* \* pressures mean for height -10% to +5% in steps of 5% \* \* temperatures -10 deg to +20 deg with respect to 280 deg at SL relative humidity 0, 0.5, 1 wavelengths 0.4, 0.6, ... 2 micron, + radio zenith distances 15, 45, 75 degrees \* \* \* \* \* \* \* \* \* \* The accuracy with respect to raytracing through a model \* \* atmosphere was as follows: \* \* \* \* RMS worst \* \* \* \* optical/IR 62 mas 8 mas \* \* 319 mas radio 49 mas \* \* \* \* For this particular set of conditions: \* \* \* \* lapse rate 0.0065 K/meter \* \* latitude 50 degrees \* \* sea level \* \* pressure 1005 mb \* \* temperature 280.15 K \* \* humidity 80% \* \* wavelength 5740 Angstroms \* \* \* \* the results were as follows:

\* \* \* \* ZD iauRefco Saastamoinen raytrace \* \* \* \* 10 10.27 10.27 10.27 \* \* 20 21.19 21.20 21.19 \* \* 30 33.61 33.61 33.60 \* \* 40 48.82 48.83 48.81 \* \* 45 58.16 58.18 58.16 \* \* 50 69.28 69.30 69.27 \* \* 55 82.97 82.99 82.95 \* \* 60 100.51 100.54 100.50 \* \* 65 124.23 124.26 124.20 \* \* 70 158.63 158.68 158.61 \* \* 72 177.32 177.37 177.31 \* \* 74 200.35 200.38 200.32 \* \* 76 229.45 229.43 229.42 \* \* 78 267.44 267.29 267.41 \* \* 80 319.13 319.10 318.55 \* \* \* \* dea arcsec arcsec arcsec \* \* \* \* The values for Saastamoinen's formula (which includes terms \* \* up to tan<sup>5</sup>) are taken from Hohenkerk and Sinclair (1985). \* \* \* \* 3) A wl value in the range 0-100 selects the optical/IR case and is \* \* wavelength in micrometers. Any value outside this range selects \* \* the radio case. \* \* \* \* 4) Outlandish input parameters are silently limited to \* \* mathematically safe values. Zero pressure is permissible, and \* \* causes zeroes to be returned. \* \* \* \* 5) The algorithm draws on several sources, as follows: \* \* \* \* a) The formula for the saturation vapour pressure of water as \* \* a function of temperature and temperature is taken from \* \* Equations (A4.5-A4.7) of Gill (1982). \* \* \* \* b) The formula for the water vapour pressure, given the \* \* saturation pressure and the relative humidity, is from \* \* Crane (1976), Equation (2.5.5). \* \* \* \* c) The refractivity of air is a function of temperature, \* \* total pressure, water-vapour pressure and, in the case of optical/IR, wavelength. The formulae for the two cases are developed from Hohenkerk & Sinclair (1985) and Rueger (2002). \* \* \* \* \* \* \* \* d) The formula for beta, the ratio of the scale height of the \* \* atmosphere to the geocentric distance of the observer, is \* \* an adaption of Equation (9) from Stone (1996). The adaptations, arrived at empirically, consist of (i) a small adjustment to the coefficient and (ii) a humidity term for the \* \* \* \* \* \* radio case only. \* \* \* \* e) The formulae for the refraction constants as a function of \* \* n-1 and beta are from Green (1987), Equation (4.31). \* \* \* \* References: \* \* Crane, R.K., Meeks, M.L. * *
    Angular separation between two p-vectors.
* *
    This function is part of the International Astronomical Union's SOFA (Standards Of Fundamental Astronomy) software collection.
* *
* *
* *
* *
    Status: vector/matrix support function.
* *
* *
    Given:
* *
                                first p-vector (not necessarily unit length)
                double[3]
       а
* *
                                second p-vector (not necessarily unit length)
        h
                double[3]
* *
* *
    Returned (function value):
* *
                                angular separation (radians, always positive)
                double
* *
* *
    Notes:
* *
* *
    1) If either vector is null, a zero result is returned.
* *
* *
    2) The angular separation is most simply formulated in terms of
* *
        scalar product. However, this gives poor accuracy for angles
near zero and pi. The present algorithm uses both cross product
* *
* *
        and dot product, to deliver full accuracy whatever the size of
* *
        the angle.
* *

For example, JD(TDB)=2450123.7 could be \* \* expressed in any of these ways, among others: \* \* \* \* epna epnb \* \* \* \* 2450123.7 0.0 (JD method) \* \* -1421.3 2451545.0 (J2000 method) \* \* 2400000.5 (MJD method) 50123.2 \* \* 2450123.5 0.2 (date & time method) \* \* \* \* The JD method is the most natural and convenient to use in \* \* cases where the loss of several decimal digits of resolution \* \* is acceptable. The J2000 method is best matched to the way \* \* the argument is handled internally and will deliver the \* \* optimum resolution. The MJD method and the date & time methods \* \* are both good compromises between resolution and convenience. \* \* \* \* 2) In accordance with normal star-catalog conventions, the object's \* \* right ascension and declination are freed from the effects of \* \* secular aberration. The frame, which is aligned to the catalog equator and equinox, is Lorentzian and centered on the SSB. \* \*

\* \* \* \* The proper motions are the rate of change of the right ascension \* \* and declination at the catalog epoch and are in radians per TDB \* \* Julian year. \* \* \* \* The parallax and radial velocity are in the same frame. \* \* \* \* 3) Care is needed with units. The star coordinates are in radians \* \* and the proper motions in radians per Julian year, but the \* \* parallax is in arcseconds. \* \* \* \* 4) The RA proper motion is in terms of coordinate angle, not true angle. If the catalog uses arcseconds for both RA and Dec proper motions, the RA proper motion will need to be divided by cos(Dec) \* \* \* \* \* \* before use. \* \* \* \* 5) Straight-line motion at constant speed, in the inertial frame, \* \* is assumed. \* \* \* \* 6) An extremely small (or zero or negative) parallax is interpreted \* \* to mean that the object is on the "celestial sphere", the radius \* \* of which is an arbitrary (large) value (see the iauStarpv \* \* function for the value used). When the distance is overridden in \* \* this way, the status, initially zero, has 1 added to it. \* \* \* \* 7) If the space velocity is a significant fraction of c (see the \* \* constant VMAX in the function iauStarpv), it is arbitrarily set \* \* to zero. When this action occurs, 2 is added to the status. \* \* \* \* 8) The relativistic adjustment carried out in the iauStarpv function \* \* involves an iterative calculation. If the process fails to \* \* converge within a set number of iterations, 4 is added to the \* \* status. \* \* \* \* Called: \* \* iauStarpv star catalog data to space motion pv-vector \* \* iauPvu update a pv-vector \* \* iauPdp scalar product of two p-vectors \* \* iauPvstar space motion pv-vector to star catalog data \* \*

* *
* *
    Notes:
* *
* *
    1) The star data accepted by this function are "observables" for an
* *
        imaginary observer at the solar-system barycenter. Proper motion
* *
        and radial velocity are, strictly, in terms of barycentric
        coordinate time, TCB. For most practical applications, it is permissible to neglect the distinction between TCB and ordinary
* *
* *
* *
        "proper" time on Earth (TT/TAI). The result will, as a rule, be
        limited by the intrinsic accuracy of the proper-motion and radial-velocity data; moreover, the pv-vector is likely to be
* *
* *
* *
        merely an intermediate result, so that a change of time unit
* *
        would cancel out overall.
* *
* *
        In accordance with normal star-catalog conventions, the object's
* *
        right ascension and declination are freed from the effects of
* *
        secular aberration. The frame, which is aligned to the catalog equator and equinox, is Lorentzian and centered on the SSB.
* *
* *
* *
    2) The resulting position and velocity pv-vector is with respect to
* *
        the same frame and, like the catalog coordinates, is freed from
* *
        the effects of secular aberration. Should the "coordinate
* *
        direction", where the object was located at the catalog epoch, be
* *
        required, it may be obtained by calculating the magnitude of the
* *
        position vector pv[0][0-2] dividing by the speed of light in au/day to give the light-time, and then multiplying the space
* *
* *
        velocity pv[1][0-2] by this light-time and adding the result to
* *
        pv[0][0-2].
* *
* *
        Summarizing, the pv-vector returned is for most stars almost
* *
        identical to the result of applying the standard geometrical "space motion" transformation. The differences, which are the
* *
* *
        subject of the Stumpff paper referenced below, are:
* *
* *
        (i) In stars with significant radial velocity and proper motion,
* *
        the constantly changing light-time distorts the apparent proper
* *
        motion. Note that this is a classical, not a relativistic,
* *
        effect.
```

\* \* \* \* (ii) The transformation complies with special relativity. \* \* \* \* 3) Care is needed with units. The star coordinates are in radians \* \* and the proper motions in radians per Julian year, but the \* \* parallax is in arcseconds; the radial velocity is in km/s, but \* \* the pv-vector result is in au and au/day. \* \* \* \* 4) The RA proper motion is in terms of coordinate angle, not true angle. If the catalog uses arcseconds for both RA and Dec proper motions, the RA proper motion will need to be divided by cos(Dec) \* \* \* \* \* \* before use. \* \* \* \* 5) Straight-line motion at constant speed, in the inertial frame, \* \* is assumed. \* \* \* \* 6) An extremely small (or zero or negative) parallax is interpreted \* \* to mean that the object is on the "celestial sphere", the radius \* \* of which is an arbitrary (large) value (see the constant PXMIN). When the distance is overridden in this way, the status, \* \* \* \* initially zero, has 1 added to it. \* \* \* \* 7) If the space velocity is a significant fraction of c (see the \* \* constant VMAX), it is arbitrarily set to zero. When this action \* \* occurs, 2 is added to the status. \* \* \* \* 8) The relativistic adjustment involves an iterative calculation. \* \* If the process fails to converge within a set number (IMAX) of \* \* iterations, 4 is added to the status. \* \* \* \* 9) The inverse transformation is performed by the function \* \* iauPvstar. \* \* \* \* Called: \* \* iauS2pv spherical coordinates to pv-vector \* \* modulus of p-vector iauPm \* \* iauZp zero p-vector \* \* decompose p-vector into modulus and direction iauPn \* \* iauPdp scalar product of two p-vectors \* \* multiply p-vector by scalar iauSxp \* \* iauPmp p-vector minus p-vector \* \* iauPpp p-vector plus p-vector \* \* \* \* Reference: \* \* \* \* Stumpff, P., 1985, Astron.Astrophys. 144, 232-240. \* \* \*/

int iauTaiutc(double tai1, double tai2, double *utc1, double *utc2)
/
**
* *
    iauTaiutc
* *
* *
    Time scale transformation: International Atomic Time, TAI, to Coordinated Universal Time, UTC.
* *
* *
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
    Status: canonical.
* *
* *
    Given:
* *
       tail,tai2 double TAI as a 2-part Julian Date (Note 1)
* *
* *
    Returned:
* *
       utc1,utc2 double
                            UTC as a 2-part quasi Julian Date (Notes 1-3)
* *
* *
    Returned (function value):
* *
                   int
                            status: +1 = dubious year (Note 4)
* *
                                      0 = OK
* *
                                     -1 = unacceptable date
* *
* *
    Notes:
* *
* *
    1) tai1+tai2 is Julian Date, apportioned in any convenient way
* *
       between the two arguments, for example where tail is the Julian
* *
       Day Number and tai2 is the fraction of a day. The returned utcl
* *
       and utc2 form an analogous pair, except that a special convention
* *
       is used, to deal with the problem of leap seconds - see the next
* *
       note.
* *
* *
    2) JD cannot unambiguously represent UTC during a leap second unless
* *
       special measures are taken. The convention in the present
* *
       function is that the JD day represents UTC days whether the
* *
       length is 86399, 86400 or 86401 SI seconds. In the 1960-1972 era
* *
       there were smaller jumps (in either direction) each time the
* *
       linear UTC(TAI) expression was changed, and these "mini-leaps"
* *
       are also included in the SOFA convention.
* *
* *
    3) The function iauD2dtf can be used to transform the UTC quasi-JD
* *
       into calendar date and clock time, including UTC leap second
* *
       handling.
* *
* *
    4) The warning status "dubious year" flags UTCs that predate the
* *
       introduction of the time scale or that are too far in the future
* *
       to be trusted. See iauDat for further details.
* *
* *

* *
       Day Number and tcb2 is the fraction of a day. The returned
* *
        tdb1,tdb2 follow suit.
* *
* *
    2) The 2006 IAU General Assembly introduced a conventional linear transformation between TDB and TCB. This transformation
* *
* *
        compensates for the drift between TCB and terrestrial time TT,
       and keeps TDB approximately centered on TT. Because the relationship between TT and TCB depends on the adopted solar
* *
* *
* *
        system ephemeris, the degree of alignment between TDB and TT over
* *
        long intervals will vary according to which ephemeris is used.
* *
       Former definitions of TDB attempted to avoid this problem by
* *
        stipulating that TDB and TT should differ only by periodic
* *
        effects. This is a good description of the nature of the
* *
       relationship but eluded precise mathematical formulation.
                                                                         The
* *
        conventional linear relationship adopted in 2006 sidestepped
* *
        these difficulties whilst delivering a TDB that in practice was
* *
        consistent with values before that date.
* *
* *
    3) TDB is essentially the same as Teph, the time argument for the
* *
        JPL solar system ephemerides.

    In the tangent plane projection, given the rectangular coordinates
* *
    of a star and its spherical coordinates, determine the spherical
* *
    coordinates of the tangent point.
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
    Status: support function.
* *
* *
    Given:
* *
        xi.eta
                     double rectangular coordinates of star image (Note 2)
* *
        a,b
                     double star's spherical coordinates (Note 3)
* *
* *
    Returned:
        *a01,*b01
                     double tangent point's spherical coordinates, Soln. 1
double tangent point's spherical coordinates, Soln. 2
* *
* *
        *a02,*b02
* *
* *
    Returned (function value):
* *
                               number of solutions:
                     int
* *
                               0 = no solutions returned (Note 5)
* *
                               1 = only the first solution is useful (Note 6)
* *
                               2 = both solutions are useful (Note 6)
* *
* *
    Notes:
* *
* *
    1) The tangent plane projection is also called the "gnomonic
* *
        projection" and the "central projection".
* *
* *
     2) The eta axis points due north in the adopted coordinate system.
* *
        If the spherical coordinates are observed (RA,Dec), the tangent
* *
        plane coordinates (xi,eta) are conventionally called the
* *
        "standard coordinates". If the spherical coordinates are with
        respect to a right-handed triad, (xi,eta) are also right-handed.
The units of (xi,eta) are, effectively, radians at the tangent
* *
* *
* *
        point.
* *
* *
    3) All angular arguments are in radians.
* *
* *
    4) The angles a01 and a02 are returned in the range 0-2pi. The
        angles b01 and b02 are returned in the range +/-pi, but in the
* *
* *
        usual, non-pole-crossing, case, the range is +/-pi/2.
* *
* *
     5) Cases where there is no solution can arise only near the poles.
* *
        For example, it is clearly impossible for a star at the pole
        itself to have a non-zero xi value, and hence it is meaningless
* *
* *
        to ask where the tangent point would have to be to bring about
* *
        this combination of xi and dec.
* *
* *
    6) Also near the poles, cases can arise where there are two useful
* *
        solutions. The return value indicates whether the second of the
* *
        two solutions returned is useful; 1 indicates only one useful
* *
        solution, the usual case.
* *
* *
    7) The basis of the algorithm is to solve the spherical triangle PSC,
* *
        where P is the north celestial pole, S is the star and C is the
        tangent point. The spherical coordinates of the tangent point are [a0,b0]; writing rho<sup>2</sup> = (xi<sup>2</sup>+eta<sup>2</sup>) and r<sup>2</sup> = (1+rho<sup>2</sup>), side c is then (pi/2-b), side p is sqrt(xi<sup>2</sup>+eta<sup>2</sup>) and side s (to be
* *
* *
* *
* *
        found) is (pi/2-b0). Angle C is given by sin(C) = xi/rho and
        \cos(C) = eta/rho. Angle P (to be found) is the longitude difference between star and tangent point (a-a0).
* *
* *
* *
* *
    8) This function is a member of the following set:

                            1 = only the first solution is useful (Note 5)
* *
                            2 = both solutions are useful (Note 5)
* *
* *
    Notes:
* *
* *
    1) The tangent plane projection is also called the "gnomonic
* *
       projection" and the "central projection".
* *
* *
    2) The eta axis points due north in the adopted coordinate system.
* *
       If the direction cosines represent observed (RA,Dec), the tangent
* *
       plane coordinates (xi,eta) are conventionally called the
* *
       "standard coordinates". If the direction cosines are with
       respect to a right-handed triad, (xi,eta) are also right-handed.
The units of (xi,eta) are, effectively, radians at the tangent
* *
* *
* *
       point.
* *
* *
    3) The vector v must be of unit length or the result will be wrong.
* *
* *
    4) Cases where there is no solution can arise only near the poles.
* *
       For example, it is clearly impossible for a star at the pole
* *
       itself to have a non-zero xi value, and hence it is meaningless
* *
       to ask where the tangent point would have to be.
* *
* *
    5) Also near the poles, cases can arise where there are two useful
* *
       solutions. The return value indicates whether the second of the
       two solutions returned is useful; 1 indicates only one useful
* *
* *
       solution, the usual case.
* *
* *
    6) The basis of the algorithm is to solve the spherical triangle
* *
       PSC, where P is the north celestial pole, S is the star and C is
* *
       the tangent point. Calling the celestial spherical coordinates
* *
       of the star and tangent point (a,b) and (a0,b0) respectively, and
* *
       writing rho^2 = (xi^2+eta^2) and r^2 = (1+rho^2), and
* *
       transforming the vector v into (a,b) in the normal way, side c is
* *
       then (pi/2-b), side p is sqrt(xi^2+eta^2) and side s (to be
* *
       found) is (pi/2-b0), while angle C is given by sin(C) = xi/rho
* *
       and cos(C) = eta/rho; angle P (to be found) is (a-a0). After
       solving the spherical triangle, the result (a0,b0) can be
* *
* *
       expressed in vector form as v0.
* *
* *
    7) This function is a member of the following set:
* *
* *
           spherical
                                          solve for

* *
                              status: 0 = OK
                  int
* *
                                       1 = star too far from axis
* *
                                       2 = antistar on tangent plane
* *
                                       3 = antistar too far from axis
* *
* *
    Notes:
* *
* *
    1) The tangent plane projection is also called the "gnomonic
* *
       projection" and the "central projection".
* *
* *
    2) The eta axis points due north in the adopted coordinate system.
* *
       If the direction cosines represent observed (RA,Dec), the tangent
* *
       plane coordinates (xi,eta) are conventionally called the
* *
        "standard coordinates". If the direction cosines are with
* *
       respect to a right-handed triad, (xi,eta) are also right-handed.
* *
       The units of (xi,eta) are, effectively, radians at the tangent
* *
       point.
* *
* *
    3) The method used is to extend the star vector to the tangent
* *
       plane and then rotate the triad so that (x,y) becomes (xi,eta).
* *
       Writing (a,b) for the celestial spherical coordinates of the
* *
       star, the sequence of rotations is (a+pi/2) around the z-axis
* *
       followed by (pi/2-b) around the x-axis.
* *
* *
    4) If vector v0 is not of unit length, or if vector v is of zero
* *
       length, the results will be wrong.
* *
* *
    5) If v0 points at a pole, the returned (xi,eta) will be based on
       the arbitrary assumption that the longitude coordinate of the tangent point is zero.
* *
* *
* *
* *
    6) This function is a member of the following set:
* *
* *
            spherical
                            vector
                                             solve for
* *
* *
            iauTpxes
                         > iauTpxev <
                                             xi.eta

    1) ttl+tt2 is Julian Date, apportioned in any convenient way between
* *
* *
        the two arguments, for example where ttl is the Julian Day Number
* *
       and tt2 is the fraction of a day. The returned tdb1,tdb2 follow
* *
       suit.
* *
* *
    2) The argument dtr represents the quasi-periodic component of the
* *
       GR transformation between TT and TCB. It is dependent upon the
* *
        adopted solar-system ephemeris, and can be obtained by numerical
* *
        integration, by interrogating a precomputed time ephemeris or by
       evaluating a model such as that implemented in the SOFA function
iauDtdb. The quantity is dominated by an annual term of 1.7 ms
* *
* *
* *
       amplitude.
* *
* *
    3) TDB is essentially the same as Teph, the time argument for the JPL
* *
       solar system ephemerides.

    This function is part of the International Astronomical Union's
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
    Status: canonical.
* *
* *
    Given:
* *
       ut11,ut12 double
                            UT1 as a 2-part Julian Date (Note 1)
* *
                            Delta UT1: UT1-UTC in seconds (Note 2)
       dut1
                  double
* *
* *
    Returned:
* *
      utc1,utc2 double
                            UTC as a 2-part quasi Julian Date (Notes 3,4)
* *
* *
    Returned (function value):
* *
                            status: +1 = dubious year (Note 5)
                   int
* *
                                     0 = OK
* *
                                     -1 = unacceptable date
* *
* *
    Notes:
* *
* *
    1) utll+utl2 is Julian Date, apportioned in any convenient way
* *
       between the two arguments, for example where utll is the Julian
* *
       Day Number and ut12 is the fraction of a day. The returned utc1
* *
       and utc2 form an analogous pair, except that a special convention
* *
       is used, to deal with the problem of leap seconds - see Note 3.
* *
* *
    2) Delta UT1 can be obtained from tabulations provided by the
* *
       International Earth Rotation and Reference Systems Service.
                                                                       The
* *
       value changes abruptly by 1s at a leap second; however, close to
* *
       a leap second the algorithm used here is tolerant of the "wrong"
* *
       choice of value being made.
* *
* *
    3) JD cannot unambiguously represent UTC during a leap second unless
       special measures are taken. The convention in the present
* *
* *
       function is that the returned quasi JD day UTC1+UTC2 represents
* *
       UTC days whether the length is 86399, 86400 or 86401 SI seconds.
* *
* *
    4) The function iauD2dtf can be used to transform the UTC quasi-JD
* *
       into calendar date and clock time, including UTC leap second
* *
       handling.
* *
* *
    5) The warning status "dubious year" flags UTCs that predate the
* *
       introduction of the time scale or that are too far in the future
       to be trusted. See iauDat for further details.
* *
* *
* *

```
int iauUtctai(double utc1, double utc2, double *tai1, double *tai2)
/
**
* *
     iauUtctai
* *
* *
* *
    Time scale transformation: Coordinated Universal Time, UTC, to
* *
    International Atomic Time, TAI.
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
    Status: canonical.
* *
* *
    Given:
* *
       utcl,utc2 double UTC as a 2-part quasi Julian Date (Notes 1-4)
* *
* *
    Returned:
* *
       tai1,tai2 double
                            TAI as a 2-part Julian Date (Note 5)
* *
* *
    Returned (function value):
* *
                   int
                             status: +1 = dubious year (Note 3)
* *
                                      0 = OK
* *
                                     -1 = unacceptable date
* *
* *
    Notes:
* *
* *
    1) utcl+utc2 is quasi Julian Date (see Note 2), apportioned in any
* *
       convenient way between the two arguments, for example where utcl
* *
       is the Julian Day Number and utc2 is the fraction of a day.
* *
* *
    2) JD cannot unambiguously represent UTC during a leap second unless
* *
       special measures are taken. The convention in the present
* *
       function is that the JD day represents UTC days whether the
* *
       length is 86399, 86400 or 86401 SI seconds. In the 1960-1972 era
* *
       there were smaller jumps (in either direction) each time the
* *
       linear UTC(TAI) expression was changed, and these "mini-leaps"
* *
       are also included in the SOFA convention.
* *
* *
    3) The warning status "dubious year" flags UTCs that predate the
* *
       introduction of the time scale or that are too far in the future
* *
       to be trusted. See iauDat for further details.
* *
* *
    4) The function iauDtf2d converts from calendar date and time of day
* *
       into 2-part Julian Date, and in the case of UTC implements the
* *
       leap-second-ambiguity convention described above.
* *
* *
    5) The returned TAI1, TAI2 are such that their sum is the TAI Julian
* *
       Date.
* *
* *
    Called:
* *
       iauJd2cal
                     JD to Gregorian calendar
* *
                     delta(AT) = TAI-UTC
       iauDat
* *
       iauCal2jd
                     Gregorian calendar to JD
* *
* *
    References:

* *
    Time scale transformation: Coordinated Universal Time, UTC, to
* *
    Universal Time, UT1.
* *
* *
    This function is part of the International Astronomical Union's
* *
    SOFA (Standards of Fundamental Astronomy) software collection.
* *
* *
    Status: canonical.
* *
* *
    Given:
* *
       utc1,utc2 double
                              UTC as a 2-part quasi Julian Date (Notes 1-4)
* *
                              Delta UT1 = UT1-UTC in seconds (Note 5)
       dut1
                    double
* *
* *
    Returned:
* *
       ut11,ut12 double
                              UT1 as a 2-part Julian Date (Note 6)
* *
* *
    Returned (function value):
* *
                              status: +1 = dubious year (Note 3)
                    int
* *
                                        0 = OK
* *
                                       -1 = unacceptable date
* *
* *
    Notes:
* *
* *
    1) utcl+utc2 is quasi Julian Date (see Note 2), apportioned in any
* *
        convenient way between the two arguments, for example where utcl
* *
        is the Julian Day Number and utc2 is the fraction of a day.
* *
* *
    2) JD cannot unambiguously represent UTC during a leap second unless
* *
        special measures are taken. The convention in the present
* *
        function is that the JD day represents UTC days whether the
* *
        length is 86399, 86400 or 86401 SI seconds.
* *
* *
    3) The warning status "dubious year" flags UTCs that predate the
       introduction of the time scale or that are too far in the future
to be trusted. See iauDat for further details.
* *
* *
* *
* *
    4) The function iauDtf2d converts from calendar date and time of
* *
        day into 2-part Julian Date, and in the case of UTC implements
* *
        the leap-second-ambiguity convention described above.
* *
* *
    5) Delta UT1 can be obtained from tabulations provided by the
* *
        International Earth Rotation and Reference Systems Service.
        It is the caller's responsibility to supply a dut1 argument containing the UT1-UTC value that matches the given UTC.
* *
* *
* *
* *
    6) The returned utll,utl2 are such that their sum is the UTl Julian
* *
       Date.
* *

void iauXy06(double date1, double date2, double \*x, double \*y) /\* \* \* \* \* іаиХуОб \* \* \* \* \* \* X,Y coordinates of celestial intermediate pole from series based \* \* on IAU 2006 precession and IAU 2000A nutation. \* \* \* \* This function is part of the International Astronomical Union's \* \* SOFA (Standards Of Fundamental Astronomy) software collection. \* \* \* \* Status: canonical model. \* \* \* \* Given: \* \* date1,date2 double TT as a 2-part Julian Date (Note 1) \* \* \* \* Returned: \* \* CIP X,Y coordinates (Note 2) double x,y \* \* \* \* Notes: \* \* \* \* 1) The TT date date1+date2 is a Julian Date, apportioned in any \* \* convenient way between the two arguments. For example, \* \* JD(TT)=2450123.7 could be expressed in any of these ways, \* \* among others: \* \* \* \* date1 date2 \* \* \* \* 2450123.7 0.0 (JD method) -1421.3 \* \* (J2000 method) 2451545.0 \* \* 2400000.5 50123.2 (MJD method) \* \* 2450123.5 0.2 (date & time method) \* \* \* \* The JD method is the most natural and convenient to use in \* \* cases where the loss of several decimal digits of resolution \* \* is acceptable. The J2000 method is best matched to the way the argument is handled internally and will deliver the \* \* \* \* optimum resolution. The MJD method and the date & time methods \* \* are both good compromises between resolution and convenience. \* \* \* \* 2) The X,Y coordinates are those of the unit vector towards the \* \* celestial intermediate pole. They represent the combined effects \* \* of frame bias, precession and nutation. \* \* \* \* 3) The fundamental arguments used are as adopted in IERS Conventions \* \* (2003) and are from Simon et al. (1994) and Souchay et al. \* \* (1999). \* \* \* \* 4) This is an alternative to the angles-based method, via the SOFA \* \* function iauFw2xy and as used in iauXys06a for example. The two \* \* methods agree at the 1 microarcsecond level (at present), a \* \* negligible amount compared with the intrinsic accuracy of the \* \* models. However, it would be unwise to mix the two methods \* \* (angles-based and series-based) in a single application. \* \* \* \* Called: mean anomaly of the Moon mean anomaly of the Sun \* \* iauFal03 \* \* iauFalp03 \* \* mean argument of the latitude of the Moon iauFaf03 \* \* mean elongation of the Moon from the Sun iauFad03 \* \* mean longitude of the Moon's ascending node iauFaom03 \* \* iauFame03 mean longitude of Mercury \* \* iauFave03 mean longitude of Venus \* \* mean longitude of Earth iauFae03 \* \* iauFama03 mean longitude of Mars \* \* iauFaju03 mean longitude of Jupiter \* \* iauFasa03 mean longitude of Saturn \* \* iauFaur03 mean longitude of Uranus \* \* iauFane03 mean longitude of Neptune \* \* general accumulated precession in longitude iauFapa03

                                             (JD method)
* *
                             -1421.3
            2451545.0
                                             (J2000 method)
* *
            2400000.5
                             50123.2
                                             (MJD method)
* *
                                             (date & time method)
            2450123.5
                                  0.2
* *
* *
       The JD method is the most natural and convenient to use in
* *
       cases where the loss of several decimal digits of resolution
       is acceptable. The J2000 method is best matched to the way the argument is handled internally and will deliver the
* *
* *
* *
       optimum resolution. The MJD method and the date & time methods
* *
       are both good compromises between resolution and convenience.
* *
* *
    2) The Celestial Intermediate Pole coordinates are the x,y components
* *
       of the unit vector in the Geocentric Celestial Reference System.
* *
* *
    3) The CIO locator s (in radians) positions the Celestial
* *
       Intermediate Origin on the equator of the CIP.
* *
* *
    4) Series-based solutions for generating X and Y are also available:
* *
       see Capitaine & Wallace (2006) and iauXy06.

## COPYRIGHT NOTICE

Text equivalent to that below appears at the end of every SOFA routine (with one exception). There are small formatting differences between the Fortran and C versions.

The one exception is the "leap second" routine DAT. This uniquely is classified as "user replaceable", and has a mitigated license statement that permits the distribution of local variants under the same name. This measure allows other SOFA routines to call the local variant, which may be file or network based, or otherwise equipped to pick up IERS leap second updates with no need to download new SOFA code.

\*+-----Copyright (C) 2019 Standards Of Fundamental Astronomy Board \* of the International Astronomical Union. \* SOFA Software License \_\_\_\_\_ NOTICE TO USER: BY USING THIS SOFTWARE YOU ACCEPT THE FOLLOWING SIX TERMS AND \* \* CONDITIONS WHICH APPLY TO ITS USE. 1. The Software is owned by the IAU SOFA Board ("SOFA"). 2. Permission is granted to anyone to use the SOFA software for any purpose, including commercial applications, free of charge and without payment of royalties, subject to the conditions and restrictions listed below. 3. You (the user) may copy and distribute SOFA source code to others, and use and adapt its code and algorithms in your own software, on a world-wide, royalty-free basis. That portion of your distribution that does not consist of intact and unchanged copies of SOFA source code files is a "derived work" that must comply with the following requirements: a) Your work shall be marked or carry a statement that it (i) uses routines and computations derived by you from software provided by SOFA under license to you; and (ii) does not itself constitute software provided by and/or endorsed by SOFA. b) The source code of your derived work must contain descriptions of how the derived work is based upon, contains and/or differs from the original SOFA software. c) The names of all routines in your derived work shall not include the prefix "iau" or "sofa" or trivial modifications thereof such as changes of case. d) The origin of the SOFA components of your derived work must not be misrepresented; you must not claim that you wrote the original software, nor file a patent application for SOFA software or algorithms embedded in the SOFA software. e) These requirements must be reproduced intact in any source distribution and shall apply to anyone to whom you have granted a further right to modify the source code of your derived work. \* Note that, as originally distributed, the SOFA software is intended to be a definitive implementation of the IAU standards, and consequently third-party modifications are discouraged. All variations, no matter how minor, must be explicitly marked as

such, as explained above.

\*

\* 4. You shall not cause the SOFA software to be brought into \* disrepute, either by misuse, or use for inappropriate tasks, or by inappropriate modification. 5. The SOFA software is provided "as is" and SOFA makes no warranty \* SOFA does not and cannot warrant as to its use or performance. the performance or results which the user may obtain by using the \* SOFA software. SOFA makes no warranties, express or implied, as to non-infringement of third party rights, merchantability, or \* fitness for any particular purpose. In no event will SOFA be liable to the user for any consequential, incidental, or special damages, including any lost profits or lost savings, even if a SOFA representative has been advised of such damages, or for any claim by any third party. 6. The provision of any version of the SOFA software under the terms and conditions specified herein does not imply that future \* versions will also be made available under the same terms and \* conditions. \* \* In any published work or commercial product which uses the SOFA software directly, acknowledgement (see www.iausofa.org) is appreciated. Correspondence concerning SOFA software should be addressed as follows: By email: sofa@ukho.gov.uk By post: IAU SOFA Center HM Nautical Almanac Office UK Hydrographic Office Admiralty Way, Taunton Somerset, TA1 2DN United Kingdom \_\_\_\_\_

     CONDITIONS WHICH APPLY TO ITS USE.
```

\* \* \* \* 1. The Software is owned by the IAU SOFA Board ("SOFA"). \* \* \* \* 2. Permission is granted to anyone to use the SOFA software for any purpose, including commercial applications, free of charge and \* \* \* \* without payment of royalties, subject to the conditions and \* \* restrictions listed below. \* \* \* \* 3. You (the user) may copy and distribute SOFA source code to others, \* \* and use and adapt its code and algorithms in your own software, \* \* on a world-wide, royalty-free basis. That portion of your distribution that does not consist of intact and unchanged copies \* \* \* \* of SOFA source code files is a "derived work" that must comply \* \* with the following requirements: \* \* \* \* a) Your work shall be marked or carry a statement that it \* \* (i) uses routines and computations derived by you from \* \* software provided by SOFA under license to you; and (ii) does not itself constitute software provided by and/or \* \* \* \* endorsed by SOFA. \* \* \* \* b) The source code of your derived work must contain descriptions \* \* of how the derived work is based upon, contains and/or differs \* \* from the original SOFA software. \* \* \* \* c) The names of all routines in your derived work shall not \* \* include the prefix "iau" or "sofa" or trivial modifications \* \* thereof such as changes of case. \* \* \* \* d) The origin of the SOFA components of your derived work must \* \* not be misrepresented; you must not claim that you wrote the \* \* original software, nor file a patent application for SOFA \* \* software or algorithms embedded in the SOFA software. \* \* \* \* e) These requirements must be reproduced intact in any source \* \* distribution and shall apply to anyone to whom you have \* \* granted a further right to modify the source code of your \* \* derived work. \* \* \* \* Note that, as originally distributed, the SOFA software is \* \* intended to be a definitive implementation of the IAU standards, \* \* and consequently third-party modifications are discouraged. All \* \* variations, no matter how minor, must be explicitly marked as \* \* such, as explained above. \* \* \* \* 4. You shall not cause the SOFA software to be brought into \* \* disrepute, either by misuse, or use for inappropriate tasks, or \* \* by inappropriate modification. \* \* \* \* 5. The SOFA software is provided "as is" and SOFA makes no warranty as to its use or performance. SOFA does not and cannot warrant \* \* \* \* the performance or results which the user may obtain by using the \* \* SOFA software. SOFA makes no warranties, express or implied, as to non-infringement of third party rights, merchantability, or \* \* \* \* fitness for any particular purpose. In no event will SOFA be \* \* liable to the user for any consequential, incidental, or special \* \* damages, including any lost profits or lost savings, even if a \* \* SOFA representative has been advised of such damages, or for any \* \* claim by any third party. \* \* \* \* 6. The provision of any version of the SOFA software under the terms \* \* and conditions specified herein does not imply that future \* \* versions will also be made available under the same terms and \* \* conditions. \* \* In any published work or commercial product which uses the SOFA \* \* software directly, acknowledgement (see www.iausofa.org) is \* \* appreciated. \* \* \* \* Correspondence concerning SOFA software should be addressed as \* \* follows: \* \* \* \* By email: sofa@ukho.gov.uk

/\*-\_\_\_\_\_ \* \* \* \* Copyright (C) 2019 \* \* Standards Of Fundamental Astronomy Board \* \* of the International Astronomical Union. \* \* \* \* \_\_\_\_\_ \* \* SOFA Software License \* \* \_\_\_\_\_ \* \* \* \* NOTICE TO USER: \* \* \* \* BY USING THIS SOFTWARE YOU ACCEPT THE FOLLOWING SIX TERMS AND \* \* CONDITIONS WHICH APPLY TO ITS USE. \* \* \* \* 1. The Software is owned by the IAU SOFA Board ("SOFA"). \* \* \* \* 2. Permission is granted to anyone to use the SOFA software for any \* \* purpose, including commercial applications, free of charge and \* \* without payment of royalties, subject to the conditions and \* \* restrictions listed below. \* \* \* \* 3. You (the user) may copy and distribute SOFA source code to others, \* \* and use and adapt its code and algorithms in your own software, \* \* on a world-wide, royalty-free basis. That portion of your distribution that does not consist of intact and unchanged copies \* \* \* \* of SOFA source code files is a "derived work" that must comply \* \* with the following requirements: \* \* \* \* a) Your work shall be marked or carry a statement that it \* \* (i) uses routines and computations derived by you from \* \* software provided by SOFA under license to you; and (ii) does not itself constitute software provided by and/or \* \* \* \* endorsed by SOFA. \* \* b) The source code of your derived work must contain descriptions of how the derived work is based upon, contains and/or differs \* \* \* \* \* \* from the original SOFA software. \* \* \* \* c) The names of all routines in your derived work shall not \* \* include the prefix "iau" or "sofa" or trivial modifications \* \* thereof such as changes of case. \* \* \* \* d) The origin of the SOFA components of your derived work must not be misrepresented; you must not claim that you wrote the original software, nor file a patent application for SOFA \* \* \* \* \* \* software or algorithms embedded in the SOFA software. \* \* \* \* e) These requirements must be reproduced intact in any source \* \* distribution and shall apply to anyone to whom you have \* \* granted a further right to modify the source code of your \* \* derived work. \* \* \* \* Note that, as originally distributed, the SOFA software is \* \* intended to be a definitive implementation of the IAU standards, \* \* and consequently third-party modifications are discouraged. All \* \* variations, no matter how minor, must be explicitly marked as \* \* such, as explained above. \* \* \* \* 4. You shall not cause the SOFA software to be brought into \* \* disrepute, either by misuse, or use for inappropriate tasks, or \* \* by inappropriate modification. \* \* \* \* 5. The SOFA software is provided "as is" and SOFA makes no warranty

as to its use or performance. SOFA does not and cannot warrant the performance or results which the user may obtain by using the \* \* \* \* \* \* SOFA software. SOFA makes no warranties, express or implied, as \* \* to non-infringement of third party rights, merchantability, or \* \* fitness for any particular purpose. In no event will SOFA be \* \* liable to the user for any consequential, incidental, or special damages, including any lost profits or lost savings, even if a SOFA representative has been advised of such damages, or for any \* \* \* \* \* \* claim by any third party. \* \* \* \* 6. The provision of any version of the SOFA software under the terms \* \* and conditions specified herein does not imply that future \* \* versions will also be made available under the same terms and \* \* conditions. \* \* \* In any published work or commercial product which uses the SOFA software directly, acknowledgement (see www.iausofa.org) is \* \* \* \* appreciated. \* \* \* \* Correspondence concerning SOFA software should be addressed as \* \* follows: \* \* \* \* By email: sofa@ukho.gov.uk \* \* IAU SOFA Center By post: \* \* HM Nautical Almanac Office \* \* UK Hydrographic Office Admiralty Way, Taunton Somerset, TA1 2DN \* \* \* \* \* \* United Kingdom \* \* \*\*\_ -----\*/

## IAU STANDARDS OF FUNDAMENTAL ASTRONOMY BOARD

## Current Membership

John Bangert - United States Naval Observatory, retired Steven Bell - Her Majesty's Nautical Almanac Office (HMNAO) Nicole Capitaine - Paris Observatory Mickaël Gastineau - Paris Observatory, IMCCE Catherine Hohenkerk - HMNAO (Chair, retired) Li Jinling - Shanghai Astronomical Observatory Brian Luzum - United States Naval Observatory (IERS) Zinovy Malkin - Pulkovo Observatory, St Petersburg Jeffrey Percival - University of Wisconsin Wendy Puatua - United States Naval Observatory Scott Ransom - National Radio Astronomy Observatory Patrick Wallace - RAL Space, retired

## Past Members

| Wim Brouw          | University of Groningen               |
|--------------------|---------------------------------------|
| Mark Calabretta    | Australia Telescope National Facility |
| William Folkner    | Jet Propulsion Laboratory             |
| Anne-Marie Gontier | Paris Observatory                     |
| George Hobbs       | Australia Telescope National Facility |
| George Kaplan      | United States Naval Observatory       |
| Dennis McCarthy    | United States Naval Observatory       |
| Skip Newhall       | Jet Propulsion Laboratory             |
| Jin Wen-Jing       | Shanghai Astronomical Observatory     |
|                    |                                       |
